Intellectual capital can be viewed as a part of the resources (input) invested by companies to gain competitive advantage and, thus, improve financial performance (output), contributing to increased corporate value (i.e., intrinsic firm value and market value) and firm wealth (outcome) (Cheng *et al.*, 2010; Molodchik *et al.*, 2012; Naidenova and Parshakov, 2013). The contribute of IC in enhancing the financial performance is valuable through the three Pulic's coefficients of VACA, VAHU and STVA (Firer and Williams, 2003; Chen *et al.*, 2005; Tan *et al.*, 2007; Chan, 2009; Cheng *et al.*, 2010). Indeed, the indices of VACA, VAHU and STVA measure the value creation efficiency of invested capital and intellectual capital components: human and structural (Pulic, 2000a,b). The more the efficiency rises, the more the corporate financial performance increase, *ceteris paribus*. Financial performance allow to give information on the effectiveness of firm strategy, contributing to affect the investors' risk perception of companies over time. It is thus expected that companies with higher IC value creation efficiency are more likely to have a MBV gap larger than one. We thus formulate the following hypotheses:

H1a. Companies with greater physical capital efficiency (VACA) are more likely to have a market-to-book ratio larger than one.

H1b. Companies with greater human capital efficiency (VAHU) are more likely to have a market-to-book ratio larger than one.

H1c. Companies with greater proportion of structural capital in the value creation (STVA) are more likely to have a market-to-book ratio larger than one.

However, in addition to financial performance, the level of market-to-book value depends on further several factors. Among these factors, non-financial information disclosed by the company is recognized as an important means for the effective functioning of capital market (Healey and Palepu, 2001). Some empirical studies support the argument that IC information is incorporated in market values (Abrahams and Sidhu, 1998; Amir and Lev, 1996; Lev and Thiagarajan, 1993; Livnat and Zarowin, 1990; Ritter and Wells, 2006). Moreover, Beattie and Thomson (2005) after examining the reasons for the extreme changes in price-to-book ratios of companies, argue that the significance of knowledge-based assets contribute to these extreme changes (see, for all, Abhayawansa and Guthrie, 2010). Consequently and given that the gathered IC information can be classified in accordance with the three main components of IC (internal structure, external

structure and human capital) (Guthrie and Petty, 2000b; Bozzolan et al., 2003, 2006), we formulate the following hypotheses:

H2a. Companies disclosing more information on the internal structure of intellectual capital in their annual reports are more likely to have a market-to-book ratio larger than one.

H2b. Companies disclosing more information on the external structure of intellectual capital in their annual reports are more likely to have a market-to-book ratio larger than one.

H2c. Companies disclosing more information on the human capital in their annual reports are more likely to have a market-to-book ratio larger than one.

An open communication strategy (non-financial information) adopted by companies is considered as a significant tool in reducing the information asymmetries between the internal and external parties' valuation of companies, thus improving market efficiency (Diamond and Verrecchia, 1991; Elliot and Jacobson, 1994; Coles et al., 1995; Botosan, 1997, 2006; Sengupta, 1998; Healey and Palepu, 2001). In particular for companies characterized by higher incidence of IC components (mostly non-recognized on balance sheet), a meaningful disclosure on IC resources should help with a fairer market assessment, by reducing the likelihood of underestimation of their intrinsic value (Lev, 2001; Van der Meer-Kooistra and Zijlstra, 2001; Marr et al., 2003) The intrinsic value of a firm can be seen (and measured) as the present value of its future earnings (Miller and Modigliani, 1966). Based on these considerations, we investigate – for the first time to our best knowledge – on the effectiveness of voluntary IC disclosure in improving the market valuation process, by testing the effects of additional IC information on the gap between market value and intrinsic value of firms characterized by higher incidence of IC components (measured by VAIC). In particular, if additional non-financial information lead to improve the market efficiency with consequently fairer market estimation; it is thus expected that for companies characterized by higher incidence of IC components (mostly non-recognized on balance sheet), a greater voluntary IC disclosure is determinant in improving the market assessment, by reducing the gap between market value and the intrinsic firm value. Therefore, we propose the following hypothesis:

H3a. Companies with a (intrinsic) firm-to-book value larger than one which are characterized by a higher incidence of IC components (VAIC) are more likely to have a market-to-book ratio larger than one, as voluntary IC disclosure increases.

3. Research design and methodology

3.1 Sample selection and data sources

The sample used to test the preceding hypotheses consists of all Italian non-financial companies listed on the Italian stock market during the period from 1 January 2008 until 31 December 2011. Because the relations examined likely differ between knowledge-intensive firms and traditional organizations, we subdivided the whole sample in two sub-samples: companies belonging to the high tech industry and traditional firms, respectively. To identify the high tech companies, we selected all of the listed companies in knowledge-intensive industries as defined by the Italian Stock Exchange, such as internet providers, biotechnology, entertainment, Internet, IT distribution, high-tech manufacturing, media, retail, software, system integration and telecommunication, and web services (Bozzolan et al., 2006). The total number of the companies with available data included in the sample is 145. We have excluded the companies with a negative value of equity. Consequently, our final sample consisting of 135 companies: 90 traditional and 45 high tech, with a total of 360 and 180 firm-year observations, respectively. We used Osiris for the analysts' earnings forecast and Datastream as a source for the other financial data; while the sources of the data to construct the disclosure indices were the annual reports. We chose annual reports because they represent an important communication tool for external stakeholders (Petty and Guthrie, 2000; Guthrie et al., 2004), especially for agents in the investment community. Indeed, the new Italian regulation concerning the disclosure of non-financial information indicates the annual report as the communication device to use for the disclosure of non-financial information on a voluntary basis. Furthermore, the annual report is regularly produced, thus offering an opportunity for analyses of disclosure policies across reporting periods (Guthrie et al., 2004).

3.2 Measurement of IC disclosure index

Based on prior research, we use a disclosure index as a measure of IC information level disseminated by companies. To build the index, we examined the annual reports of all 135 companies over the four-year analysis period (2008-2011). We conducted a content analysis to examine the IC disclosure (Guthrie et al., 2004) by coding the IC information into specific categories. To identify the IC categories, we used the framework tested by Guthrie and Petty (2000b) and also applied by Bozzolan et al. (2003; 2006). In

particular, the framework consists of three categories of intellectual capital: internal structure, external structure, and human capital. These categories and the items included under each category are illustrated in Table 1.

Table 1. The IC Framework

1. Internal structure (structural)	2. External structure (relational)	3. Human capital
Intellectual property	2.a brands	3.a Know-how
1.a patents	2.b customers	3.b education
1.b copyrights	2.c customer loyalty	3.c employees
1.c trade-marks	2.d distribution channels	3.d work-related knowledge
Infrastructure assets	2.e business collaboration	3.e work-related competence
1.d corporate culture	2.f research collaborations	
1.e management processes	2.g financial contacts	
1.f information systems	2.h licensing agreements	
1.g networking systems	2.i franchising agreements	
1.h research projects		

To construct the index, we coded each item as follows: a score of 1 if the item is reported in qualitative terms, a score of 2 if the item is reported in quantitative terms, and a score of 0 if the item is not referred to. Based on the IC framework in Table 1, we built four different indices for IC disclosure. The first one relates to the overall extent of the IC information (TICD). The next three relate to the content of the disclosed information: the disclosure index of the internal structure information (IsCD), external structure information (EsCD) and human capital information (HcD). The total score of each one, for a company is calculated in accordance with the following algorithm (Singhvi and Desai, 1971; Buzby, 1975; Eng and Mak, 2003; Oliveira et al., 2006):

$$\text{Total score} = \frac{\sum_{i=1}^m di}{m}$$

where the Total score is the disclosure index used as the dependent variable (TICD, IsCD, EsCD, HcD in this study), $di = 0$ or 1 or 2 , as follows: $di = 1$ for disclosure in qualitative terms, $di = 2$ for disclosure in quantitative terms, $di = 0$ if the disclosure item is not referred to, and $m =$ the weighted maximum number of items a company may

disclose. We calculated the four disclosure indices for each annual report. The content analysis and the construction of the index involve the subjective judgment of the researcher. This subjective nature is considered the main limitation of this methodology

(Healy and Palepu, 2001). Therefore, we were concerned about the reliability of the index, and we performed an inter-coder reliability test using the Krippendorff's alpha agreement for coding (Krippendorff, 2004). In particular, two coders (one researcher assistant and one of the two authors) built the scores, by conducting the analysis on the annual reports. A preliminary check was performed on five annual reports after a training provided to the researcher assistant by the authors. The independent scores were all above the minimum limit of acceptance of 80% (Riffe et al., 2005).

3.3 Measurement of the other independent variables

Table 2 describes how the other independent variables are measured.

Table 2. Description and measurement of variables

Variable	Description	Measurement
MBV	Market-to-book value ratio three months after the fiscal year-end	Dummy variable that takes value of 1, when market value is higher than book value; 0 otherwise
Independent variables		
IC Disclosure Indexes		
TICD	Total disclosure index on intellectual capital	Total amount of information disclosed
IsCD	total disclosure index related to internal information	Total disclosure index based on the total amount of information on the internal structure
EsCD	total disclosure index related to external information	Total disclosure index based on the total amount of information on the external structure
HcD	total disclosure index related to human capital	Total disclosure index based on the total amount of information on the human capital
Other Independent Variables		
VACA	Value Added Efficiency of physical and financial capital employed	Value added/Capital employed (Pulic model, 2000)
VAHU	Value Added Efficiency of human capital	Value added/Employee Salaries (Pulic model, 2000)
STVA	Structural capital coefficient	Structural capital/Value Added, where: Structural capital= Value added - Employee salaries (Pulic Model, 2000)
VAIC	Value Added Efficiency Intellectual Coefficient	VACA+VAHU+STVA (Pulic model, 2000)

WBV	Intrinsic-to-book value. The intrinsic value is a non-market-based estimate of firm value. The non-market-based estimate was calculated following the Ohlson (1995) and Frankel and Lee (1996) approach, as applied by Barth et al. (1998). In summary, the equation used is the following: $W_t = FE_{t+2}/(r(1+r)) + (dt*gt)/(1+r)$	Dummy variable that takes value of 1, when intrinsic value is higher than book value; 0 otherwise
	where: W_t is the present value of analysts expected future earnings plus the present value of dividends between time t and the earnings forecast period; FE_{t+2} is the median earnings forecast at the year t for year $t+2$; dt is the year t dividend; gt is the time t dividend growth rate computed over the past three years; r is the cost of equity calculated according to CAPM: $r = \text{risk-free rate} + \text{Beta factor} * (\text{Risk Premium on Market Portfolio})$	
Size	Firm Size	Natural logarithm of total assets
DY09	Dummy variable for the year 2009	
DY10	Dummy variable for the year 2010	
DY11	Dummy variable for the year 2011	

3.4 Data analyses

The data collected for this study over a four-year period (2008-2011) were examined through regression analyses. For our multivariate analysis, we use MBV as a dependent variable, which is a dichotomous variable that assumes the value 1 if market value is higher than book value, and 0 otherwise. As the dependent variable is a dummy, we apply probit regression models. Robust standard error has been used. We control our results for firm size and temporal dummies. In particular, the dummy annual controls for the presence of common trends between companies. We estimated each regression model for the two sub-samples of high tech and traditional companies, respectively. Before carrying out the regression, we verify the possible multicollinearity between explanatory variables by using the VIF (Variance Inflation Factor). The regression models which were performed to test our first two hypotheses are the following:

$$MBV = \alpha + \beta_1 VACA + \beta_2 VAHU + \beta_3 STVA + \beta_4 SIZE + \beta_5 DY09 + \beta_6 DY10 + \beta_7 DY11 + \epsilon \quad (1)$$

$$MBV = \alpha + \beta_1 VACA + \beta_2 VAHU + \beta_3 STVA + \beta_4 IsCD + \beta_5 EsCD + \beta_6 HcD + \beta_7 sSIZE + \beta_8 DY09 + \beta_9 DY10 + \beta_{10} DY11 + \epsilon \quad (2)$$

In order to test our third hypothesis, which supposes the determinant role of voluntary IC disclosure for a fairer market assessment of firms characterized by higher incidence of IC components (VAIC), we first performed the following regression function (without the voluntary IC disclosure variable):

$$MBV = \alpha + \beta_1 VAIC + \beta_2 WBV + \beta_3 VAIC * WBV + \beta_4 SIZE + \beta_5 DY09 + \beta_6 DY10 + \beta_7 DY11 + \epsilon \quad (3.1)$$

Successively, we run a further regression equation, by introducing to the previous function 3.1 the variable on voluntary IC disclosure, as follows:

$$MBV = \alpha + \beta_1 VAIC + \beta_2 TICD + \beta_3 WBV + \beta_4 VAIC * TIND * WBV + \beta_5 SIZE + \beta_6 DY09 + \beta_7 DY10 + \beta_8 DY11 + \epsilon \quad (3.2)$$

The variables are defined as follows:

MBV is the Market-to-book value three months after the fiscal year-end (dependent variable).

VACA is the Value Added Efficiency of physical and financial capital employed;

VAHU is the Value Added Efficiency of human capital;

STVA is the Structural capital coefficient;

IsCD is the total disclosure index related to internal information;

EsCD is the total disclosure index related to external information;

HcD is the total disclosure index related to human capital;

Size is the Natural logarithm of total assets;

DY09, DY10 and DY11 are the temporal dummy variables for the years 2009, 2010 and 2011.

VAIC is the Value Added Efficiency Intellectual Coefficient(VACA+VAHU+STVA);

TICD is the total disclosure index on intellectual capital;

WBV is the intrinsic value of the firm-to-book value (non-market-based estimate of firm value-to-book value).

VAIC*WBV in the interaction term;

VAIC*TICD*WBV in the interaction term.

4. Results and discussion

4.1 Descriptive statistics and univariate analysis

Tables 3A,B and tables 4A,B report the descriptive statistics and the bivariate statistical correlations between all variables with reference to the two samples of high tech and traditional companies, respectively.

MBV is the Market-to-book value as a dummy variable that takes value of 1, when market value is higher than book value; 0 otherwise; VACA is the Value Added Efficiency of physical and financial capital employed; VAHU is the Value Added Efficiency of human capital; STVA is the Structural capital coefficient; Size is the Natural logarithm of total assets; DY09, DY10 and DY11 are the temporal dummy variables for the years 2009, 2010 and 2011.

With reference to the high tech companies, we can observe that the findings are consistent with *H1b*, while *H1a* and *H1c* are not statistically validated. In particular, VAHU shows a positive and significant coefficient (at the 5% level). We also find a negative significant coefficient (at the 1% level) between the companies' size and the MBV. Among the temporal dummies control variables, the year 2009 is found to have a positive and significant coefficient (at the 1% level). For the companies belonging to the traditional industries, the results support the hypotheses *H1a* and *H1b*, while *H1c* is not validated. Specifically, VACA and VAHU present a positive and significant coefficient

(at the 1% and 5% level, respectively). The firm size variable is not significant, whereas the year dummies 2009 and 2010 show a positive and significant coefficient (both at the 1% level). It is thus interesting to note that high tech companies with higher value creation efficiency of human capital are more likely to have a market-to-book ratio larger than one, whereas a MBV larger than one is less likely among the bigger ones. Consequently, these results give empirical evidence of the primary relevance for the investors of the quality and abilities of the human capital, which represents one of the most important strategic value driver in the knowledge-intensive companies. For traditional companies the value creation efficiency of the human capital appears to reduce the likely to have a market value higher than book value of equity, whereas the value creation efficiency of physical and financial capital employed primarily influences, in a positive direction, the probability of a MBV larger than one. Moreover, the firm size on average has no impact on this probability, thus revealing for the investors the productivity gains of the capital employed. Finally, the results reveal that for high tech company a positive common trend exists only in the year 2009, while for traditional companies also for the year 2010. However, this trend is not maintained in the year 2011 for both categories of companies. One possible explanation for these results could be that the lasting effects of the financial crisis erupted in 2008 led to a stronger perception of risk by investors associated with the specific firm over time, and first of all with regard to high-tech firms characterized by more "soft assets".

Tables 6A,B report the findings from the second regression function (2), which was formulated to test our second hypothesis. Also this model is run on the two subsamples of high tech and traditional companies, respectively.

MBV is the Market-to-book value as a dummy variable that takes value of 1, when market value is higher than book value; 0 otherwise; VACA is the Value Added

Efficiency of physical and financial capital employed; VAHU is the Value Added Efficiency of human capital; STVA is the Structural capital coefficient; IsCD is the total disclosure index related to internal information; EsCD is the total disclosure index related to external information; HcD is the total disclosure index related to human capital; Size is the Natural logarithm of total assets; DY09, DY10 and DY11 are the temporal dummy variables for the years 2009, 2010 and 2011.

After controlling for the value creation efficiency coefficients VACA, VAHU and STVA, the findings give empirical support to the hypothesis *H2a* for both categories of companies analysed. However, the results show a coefficient of IsCD both higher and more statistical significant for the high tech companies compared to the traditional companies (3.07, $p < 0.01$ vs. 0.85, $p < 0.5$). Moreover, contrary to our expectations in *H2b*, we find a negative and significant coefficient of EsCD (at the 10% level) for high tech companies, while this hypothesis is not statistically validated for the traditional companies. Finally, *H2c* is not statistically supported for both types of firms. In summary, these findings show that in addition to specific IC performance, also the voluntary disclosure on internal structure of intellectual capital (non-financial information) seems to have an important role in the market valuation process, especially for the high tech companies, mostly characterized by a higher incidence of “soft assets”, like internal structural capital. As stated by Amira and Lev (1996), we can observe a “complementary” role of non-financial information in explaining the market value. As concerns the negative coefficient found with reference to the disclosure index on the relational capital (external structure of IC) of high tech firms, a plausible explanation could be that investors prefer to base the assessments of these strategic resources directly on the corporate financial performance, which also reflect the value creation efficiency of human capital as well as of physical and financial capital employed (these latter found with a positive and significant coefficient).

Finally, it is interesting to notice that the introduction of the IC disclosure variables in the model has contributed to improve its explanatory power, particularly with regard to the high tech companies (McFadden R-squared increases from 0.13 to 0.23 for high tech companies, while for traditional companies the increasing is weaker: from 0.15 to 0.16). In particular, we can observe that for high tech companies the positive coefficient of VACA become statistically significant (at the 5% level), and also the significance of the VAHU coefficient increases (from 5% to the 1% level); while for traditional companies

the negative coefficient of VAHU is no more statistically significant. Finally, the results reported in Tables 7A1, A2 and B1, B2 show that our third hypothesis (*H3a*) is empirically supported for high tech companies.

VAIC is the Value Added Efficiency Intellectual Coefficient (VACA+VAHU+STVA); TICD is the total disclosure index on intellectual capital; WBV is the intrinsic value of the firm-to-book value as a dummy variable that takes value of 1, when intrinsic value is higher than book value, 0 otherwise; VAIC*TICD*WBV in the interaction term; Size is the Natural logarithm of total assets; DY09, DY10 and DY11 are the temporal dummy variables for the years 2009, 2010 and 2011.

Specifically, with respect to high tech companies we find a positive and significant coefficient of the interaction term VAIC*TICD*WBV (0.42, $p < 0.05$), while the interaction term VAIC*WBV is not statistical significant. These findings give empirical evidence that a greater disclosure on IC appears determinant in improving the market assessment of high tech companies characterized by higher IC performance. For traditional companies, we find a positive and significant coefficient for both interaction terms: VAIC*TICD*WBV (0.16, $p < 0.10$) and VAIC*WBV (0.15, $p < 0.01$), thus showing that investors tend however to incorporate the value drivers of traditional companies (and with more statistic significance), regardless of disclosure on IC resources, maybe basing their valuations mainly on financial information as well as on other types of information channels (like the analysts).

5. Conclusions

Starting from one of the most important theory that considers the intellectual capital of companies in explaining the market and book value gap larger than one, and considering the important role of intellectual capital as a part of the resources (input) invested by companies to gain competitive advantage and, thus, improve financial performance (output), contributing to increased corporate value (i.e., intrinsic value and market value) and firm wealth (outcome), this paper first empirically tested whether the gap of market-to-book value larger than one is more likely for the Italian non-financial listed companies with higher value creation efficiency of intellectual capital. Additionally, this study investigated whether companies with higher voluntary IC disclosure are more likely to have a MBV gap larger than one, after controlling for the intellectual efficiency of the firms. A conclusive analysis is finally carried out in order to check on the effectiveness of voluntary IC disclosure in improving the market valuation process, by testing the effects of additional IC information on the gap between market value and intrinsic value of firms characterized by higher incidence of IC components (mostly non-recognized on balance sheet).

Because the relations examined likely differ across industries, we performed separated regression equations for firms in the high-tech and traditional non-financial firms, by using data over a time period of four years (2008-2011). The results give empirical evidence that high tech companies with higher value creation efficiency of human capital are more likely to have a market-to-book ratio larger than one, whereas a MBV larger than one is less likely among the bigger ones. Consequently, these findings give empirical evidence of the primary relevance for the investors of the quality and abilities of the human capital, which represents one of the most important strategic value driver in the knowledge-intensive companies. On the contrary, for traditional companies the value creation efficiency of the human capital appear to reduce the likely to have a market value higher than book value of equity, whereas the value creation efficiency of physical and financial capital employed primarily influences, in a positive direction, the market valuation of the firm, affecting the probability of a MBV larger than one. Moreover, the firm size on average has no impact on this probability, thus revealing for the investors the productivity gains of the capital employed. Finally, the results reveal that for high tech company a positive common trend exists only in the year 2009, while for traditional companies also for the year 2010. However, this trend is not maintained in the year 2011

for both categories of companies. One possible explanation to these results could be that the lasting effects of the financial crisis erupted in 2008 led to a stronger perception of risk by investors associated with the specific firm over time, and first of all with regard to high-tech firms characterized by more "soft assets". The findings from our further analysis showed that in addition to specific IC performance, also the voluntary disclosure on internal structure of intellectual capital (non-financial information) seems to have an important role in the market valuation process, especially for the high tech companies, mostly characterized by a higher incidence of "soft assets", like internal structural capital. For the high tech companies, the results also suggest that investors prefer to base the assessments of relational capital resources (external structure of IC) directly on the corporate financial performance, which also reflect the value creation efficiency of human capital as well as of physical and financial capital employed. Our final analysis reveals that a greater disclosure on IC appears determinant in improving the market assessment of high tech companies characterized by higher IC performance. For traditional companies, the findings show that investors tend however to incorporate the value drivers of these companies, regardless of disclosure on IC resources, maybe basing their valuations mainly on financial information as well as on other types of information channels (like the analysts).

This study contributes to the existing literature in a number of ways. First, the paper gives evidence that the different weight of IC in companies leads to their different relevance in the market valuation process, showing a tendency to a rational behaviour of the financial market. In fact, the investors' assessment results more based on the value creation efficiency of human capital for high tech companies, whereas for traditional firms strictly reveals the value creation efficiency of physical and financial capital. Second, this study contributes to the extant literature on the role of IC information for the efficiency of financial markets in two respects: by enhancing the understanding on the important role of information concerning internal structure of IC in the market valuation process; by testing the supposed greater accuracy of market valuation process in presence of higher information transparency through a new analysis approach. The investors' assessment is much more accurate as the market value reflects the intrinsic value of the firm. Therefore, this approach checks on the effectiveness of corporate IC voluntary disclosure in improving the accuracy of investors' assessment, by testing whether firms with an intrinsic value more than book value which are characterized by higher incidence

of IC components (mostly non-recognized on balance sheet) are more likely to have a MBV larger than one, when they disseminate more information on IC resources. This study has practical implications for various parties, such as investors and other stakeholders. It gives evidence on the important role played by voluntary IC disclosure in reducing information asymmetries between the internal and external parties' valuation of companies, primarily increasing the information held by agents in the investment community. This, in particular, in an institutional setting like Italy characterized by companies with dominant shareholders, where the information asymmetries exacerbate the agency conflicts between dominant (controlling) shareholder and minority shareholders. Moreover, the findings contribute to shed light on the effectiveness and determinant role of voluntary IC disclosure practices in improving the market assessment of high tech companies, thus reducing the possibilities of underestimation of their (more hidden) value creation drivers. Our research has a number of limitations that might warrant future research. In this study, it has assumed that higher levels of information are implicitly considered as a higher quality of disclosures., Specific aspects related to the quality of disclosure could be thus investigated to test the hypotheses. Moreover, the analysis could be extended to other countries in a comparative perspective.

Structured Abstract

This paper aims to explore the significance of intellectual capital (intangible assets) to firm performance in the context of professional football clubs. Specifically, it investigates whether the efficiency of intangible assets investments affect positively the sporting performance in a sample of Italian top-tier football clubs.

The conceptual and analytical model underlying this study is the VAIC (Value Added Intellectual Coefficient) model pioneered by Pulic (1999; 2000a,b) which is intended to measure the extent to which firms create added value based on intellectual capital efficiency (ICE).

Purpose. Through adaptations to the VAIC model, this paper aims to: 1) provide indicators suitable to measure ICE in the professional football sector; 2) to investigate empirically whether the efficiency of intangible assets investments (as measured by these indicators) is positively associated to sporting performance.

Design/methodology/approach – This paper performs a quantitative analysis based on the statistical technique known as mixed-effects linear regression for longitudinal analysis. The analysis covers a time period of five years and specifically the sporting seasons from 2007 to 2012.

Practical Implications – The results from this study provides tentative evidence that intellectual capital efficiency is positively associated to sporting performance. To football club managers it stands to suggest that importance of ongoing investments in human capital and the need to nurture positive relationship with external stakeholders.

Originality/value. To our knowledge studies of the kind in the professional football sector are in actual short supply.

Keywords – IC valuation, professional football club, Value Added Intellectual Coefficient

Paper Type – Academic Research Paper

1. Introduction

This paper aims to explore the significance of intellectual capital (intangible assets) to business performance in the professional football sector. Specifically it aims to explore the relation between intellectual capital efficiency and sporting performance in a sample of Italian top-tier football clubs.

The conceptual and analytical model underlying this study is the VAIC (Value Added Intellectual Coefficient) model pioneered by Pulic (1999; 2000a,b) which was originally intended to measure the extent to which firms create added value based on intellectual capital efficiency (ICE). By using the VAIC model and its underlying constructs as a starting framework, this paper has developed adaptations to the original formulation of VAIC in an attempt to fit the conceptual and measurement model to the peculiar features of professional football businesses. In doing so, two tentative indicators have been proposed which are intended to measure the efficiency of intangible assets (e.g. investments in playing talent) that are of great significance to professional football businesses. Then, it has been analyzed empirically the relation between the intellectual capital efficiency (as measured by the specially-devised indicators) and the sporting performance of the clubs in the sample (in terms of points achieved in the League standing at the end of each sporting season). The results from the empirical analysis appear – at least to some extent – to support the contention that investments in intellectual capital affect positively the sporting performance of football clubs.

The remainder of the paper proceeds as follows. Section 2 briefly describes the VAIC model as conceived by its originator (Ante Pulic, 1998; 2000a; 2000b), presents an overview of studies that have applied the VAIC model as well as the main criticism to this approach; Section 3 presents the empirical analysis, reports and provides a discussion on its results; Section 4, that concludes the paper, summarizes its main findings, highlights its limitations and outlines possible directions for future research.

2. Background

Ante Pulic (1998, 2000a, 2000b) proposed the VAIC method to provide information about the value creation efficiency of tangible and intangible assets in a company. Starting from Skandia Navigator (Edvinsson and Malone, 1997) and from the value added concept, Pulic constructed the VAIC as follows:

$$\text{VAIC} = \text{CEE} + \text{HCE} + \text{SCE}$$

with :

- CEE (Capital Employed Efficiency) indicator of VA efficiency of capital employed;
- HCE (Human Capital Efficiency) indicator of VA efficiency of human capital;
- SCE (Structural Capital Efficiency) indicator of VA efficiency of structural capital;

where:

- $\text{CEE} = \text{VA} / \text{CE}$ (VA = value added; CE (Capital Employed) = book value of the net assets);

- $\text{HCE} = \text{VA} / \text{HC}$ (VA = value added; HC (Human Capital) = total salaries and wages);

- $\text{SCE} = \text{SC} / \text{VA}$ (SC = VA - HC).

In several studies of his own, Pulic depicts firms' market value as stemming from capital employed and intellectual capital, the latter being defined as the 'sum' of human and structural capital. For instance, he found a significant degree of correlation between the (mean) value of intellectual capital (as measured by VAIC formulae) and firms' market value by using a sample of 30 randomly selected companies from the UK FTSE 250 between the years 1992-1998 (Pulic, 2000a).

Many researchers have used Pulic's VAIC as an efficiency measure of capital employed and intellectual capital, often with the aim to assess its impact on firm performance. Among these, Chen et al. (2005), using data drawn from Taiwanese listed companies, have explored empirically the relation between VAIC and firms' market-to-book value ratios as well as the relation between intellectual capital efficiency and firms' current and future financial performance. Their findings lend support to the hypothesis that firms' intellectual capital has a positive impact on market value and financial

performance, hence the contention that intellectual capital efficiency can be a leading indicator for firms' future financial performance.

Iazzolino, Laise and Migliano (2014) have compared VAIC with one of the most commonly used performance evaluation methods, the Economic Value Added (EVA), based on a correlation analysis on a sample of firms belonging to different industries. They found no linear correlation between these two measures of performance and explain this finding as due to the fact that EVA measures the VA from the shareholders' perspective, whilst VAIC is a measure of VA from the stakeholders point of view. Hence, they conclude, VAIC is a measure that usefully complements existing ones and thus is to be included as an innovative measure of Intellectual Capital Efficiency.

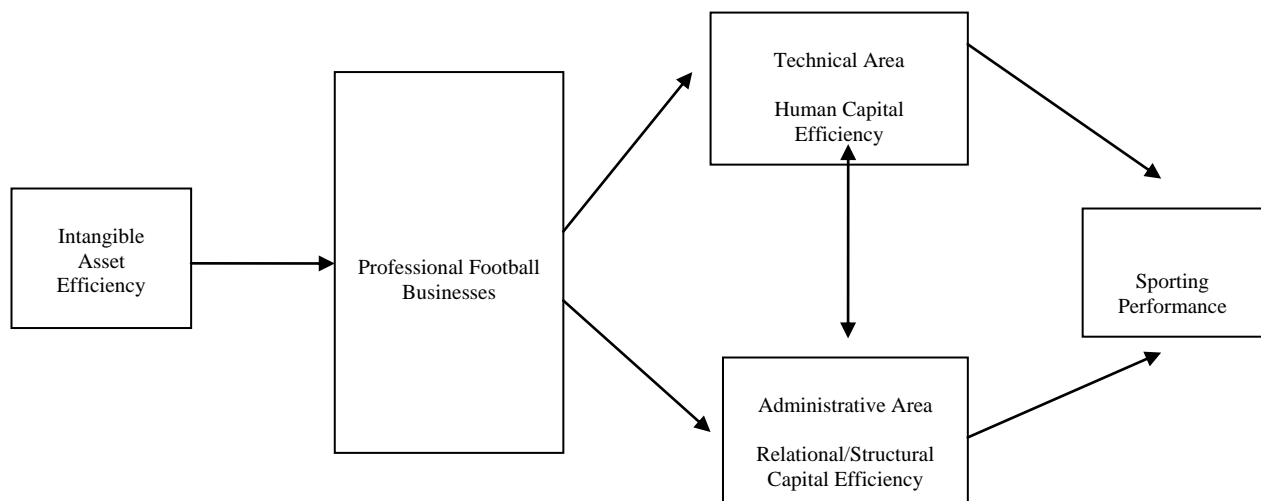

However other researchers studying the relation between intellectual capital efficiency and firm performance have reported contrasting results. For example Firer and Williams (2003) who have investigated the relationship between intellectual capital and traditional measures of corporate performance (e.g. ROA) found no strong positive impact of VAIC on profitability, productivity and market value, so they identify physical capital as the most significant source of corporate performance. By the same token, Chan (2009) has investigated empirically the relation between intellectual capital as measured by VAIC and different measures of firm financial performance, using data of all the constituent companies of the Hong Kong Stock Exchange. The results of this analysis revealed no conclusive evidence to support an association between IC and financial performances in the sample companies.

Expectedly, the VAIC method has attracted criticism. For instance, Shähle et al. (2011) show that VAIC is an invalid measure of intellectual capital. Firstly, they note, VAIC parameters merely indicate the efficiency of the company's labour and capital investments. Second, the calculation method uses overlapping variables and has other serious validity problems. Still, the results do not lend support to Pulic's hypothesis that VAIC is correlated with a company's stock market value. The main reasons behind the lack of consistency in earlier VAIC results lie in the confusion of capitalized and cash flow entities in the calculation of structural capital and in the measure of intellectual capital concepts. In doing so, the VAIC method departs from the usual tools and concepts of intellectual capital analysis, in that it considers pure financial and work efficiency variables. Besides, it is based on balance-sheet items and therefore it does not capture important constituents of intellectual capital.

3. Empirical Analysis

3.1 Research methodology

Using the VAIC model and its underlying constructs as a framework, this paper aims to measure the efficiency of intangible assets investments and its impact on sporting performance for a sample of professional football clubs playing in the top-flight division (Serie A) of Italian football, with particular respect to human and structural capital. The underlying and implicit premise for the choice of this research question lies in the assumption that sporting performance are closely tied to economic performance in the context of professional football businesses. Think, for instance, of the favorable impact that positive sporting performances (wins) can have on match revenues and merchandising sales. Based on this premise, this paper aims to explore the relation between the efficiency of intangible assets investments and sporting performance. Graphically, this can be depicted as in the following figure:

As shown in the above figure, this paper draws a (theoretical) distinction between a ‘technical’ and ‘administrative’ area of management within football clubs. By ‘technical area’ we refer to the sporting side of football club management. In terms of intangible assets, it relies primarily on the players in squad as a major constituent of its human capital. By ‘administrative area’, we refer to all activities supportive of technical activities. In terms of intangible assets, it refers to the value added created through developing positive business relationships with external stakeholders.

For either area of management, we have defined efficiency indicators specially-devised to measure the efficiency of intangible investments. In doing so, we have constructed ratios of outputs to inputs for either area.

The data used to construct these indicators have been drawn from the official balance sheets of the sample clubs from 2007 to 2012. In particular, with regard to the ‘technical area’, we have used as measures of output the revenues accruing from players’ trading (termed ‘plusvalenze’ in the Italian accounting jargon) while the values of players’ registration rights are used as measures of input. The resulting efficiency indicator expressed as HCE is as follows:

$$\text{HCE} = \text{Revenues from players' trading} / \text{Players' registration rights}$$

Instead, the efficiency indicator for intangible investments in the ‘administrative area’ has been constructed by considering the various outputs (revenues) accruing from business relationships with external stakeholders. Specifically, the external sources of revenues have been grouped as follows:

- Revenues from TV Rights;
- Corporate Image Revenues, comprised of merchandising, sponsorship and advertising revenues
- Match Revenues
- Other Revenues.

Underlying each source of revenue are different business relationships with different customer groups (e.g., respectively, television networks, consumers, spectators). Therefore all such sources of revenue taken together are considered as forming the relational capital. It should be noted however that under the rubric “corporate image revenues” one might also include the brand value of football clubs, which should nevertheless be considered as forming the structural capital of football clubs. In this paper, however, the brand value is not considered separately and thus the efficiency of relational and structural capital is measured at an aggregate level.

Specifically, the indicator for the efficiency of relational and structural capital is obtained by dividing the sum of revenues from customer capital (which intrinsically embody the brand value) by the value of total assets net of the value of players’ registration rights (as this latter value has already been included in the first indicator). The

resulting indicator referred by the acronym RSCE (= relational and structural capital efficiency) is as follows:

$$\text{RSCE} = \text{Revenues from TV rights} + \text{Corporate Image Revenues} + \text{Gate Revenues} - \text{Other Revenues} / \text{Total Assets} - \text{Players' registration rights}$$

3.2 Results

The objective of the statistical analysis presented below is to assess whether the two efficiency measures of intellectual capital affect the score achieved by clubs in the course of time. The underlying research hypothesis is as follows:

- *An increase in intellectual capital efficiency affects positively the sporting performance achieved by clubs.*

This hypothesis has been tested on a sample of professional football clubs playing in the top-flight division (Serie A) of Italian football. The data set covers a five-year time period and specifically the sporting seasons from 2007 to 2012.

To provide a balanced data panel, we chose to include in our sample only those clubs which have never been demoted from the top League in the time period being studied.

Data analysis has been made using the statistical technique known as linear mixed-effects regression model for longitudinal data. This model has been run with longitudinal data on the relative scores achieved by clubs in the whole time period. Relative scores are obtained by dividing the final score of each club by the maximum achievable score.

The following table shows the sample of football clubs on which the model has been run.

Popolazione Considerata
Cagliari
Catania
Fiorentina
Genoa
Inter
Juventus
Lazio
Milan
Napoli
Palermo
Roma
Udinese
Totale osservazioni = 60

The mixed-effects linear model attempts to fit a single regression (hyper)plane to the efficiency observations for each clubs. In the related literature, this statistical technique is referred to as multilevel model for longitudinal analysis. It not only describes the trend of the scores achieved by clubs in the five-year period under consideration, but through estimating the so-called “fixed effects” (the regression parameters describing the overall temporal trend) it shows the specific features of the evolving trend of scores by fitting them to each single club. Moreover, a description of the specific features of the temporal trend of club scores, through the so-called random effects, is offered by analyzing the relation between the context variables (as measured by HCE and RSCE) and the special features of the temporal trend of the scores achieved by clubs.

By running the model, it has been first obtained the fixed-effects solution. In particular, from this estimate it has been derived the general regression curve which represents the mean trend of the relative scores for the whole sample, as a function of the two efficiency measures for human and relational/structural capital, in the five sporting seasons being observed. In particular, the general regression curve is as follows:

$$rel_score = 0.527 - 0.00329 * time + 0.05841 * ehc - 0.01841 * ersc - 0.01483 * (time * ehc) + 0.003185 * (time * ersc)$$

Note that the general regression curve has a slope of -0,00329 and an intercept of 0,5270.

3.3 Discussion

The negative sign of the slope would suggest that the scores achieved by clubs tend to balance each other out in the course of time.

Through the model it has been also explored the relation between scores and the context effects (i.e. the efficiency measures for intellectual capital HCE and RSCE through time. In particular, the influence of the two measures on the general regression curve has been observed both with respect to slope and intercept.

Fixed-effects Solution

Effetto	Stima	Errore Standard	DF	Valore t
Intercept	0.5270	0.04907	11	10.74
TIME	- 0.00329	0.01114	11	- 0.30
C_EHC	0.05841	0.08693	32	0.67
C_ERSC	- 0.01841	0.06585	32	- 0.28
TIME*C_EHC	- 0.01483	0.02139	32	- 0.69
TIME*C_ERSC	0.003185	0.01983	32	0.16

Through the statistical processing of data it is possible to observe how, on average, an increase in the human capital efficiency interacts positively (C_HCE) with the intercept of the single regression curves of the clubs in the sample. Instead, an increase in the efficiency of relational and structural capital impact negatively (C_RSCE) the intercept of the single clubs, compared to the general regression curve.

As shown in the table, the mean effect of RSCE on the general intercept is + 0,005841. This is due to the fact that clubs characterized as having an high efficiency of human capital lie above the general regression curve. That is to say, an increase in human capital efficiency would reflect an increase in sporting performance.

Instead, the mean effect of ERSC is negative: - 0,01841. However, this negative effect, being very close to zero, can be regarded as being negligible. From a business-economics perspective, it could be inferred that an increase in investments in human/structural capital has virtually no impact on the sporting results achieved by clubs.

However, the analysis of the interaction effect of human capital and relational/structural capital on the slope of the general regression curve gives different results. In particular, the mean effect of HCE on the slope of the general regression curve is - 0,01483. This means that an increased efficiency of human capital produces a 'flattening' of the regression curve; put differently, the indicator TIME*C_EHC signals that the positive interaction effect of human capital efficiency on club performance tends to diminish over time. This might be explained as due to the fact that, while human capital efficiency, in general, impact positively club performance, this positive impact tends to decrease in significance in the medium term unless an adequate renewal of the squad occurs. This effect is in a sense 'substantiated' by the peculiarities of human resources management practices in professional football clubs, which virtually every year are given the chance to strengthen their squad through a transfer season regulated by the football association (FIGC in Italy). As a matter of fact, in no other business organization the renewal of human resources occurs at such rapid and steady pace.

It is however interesting to note that the mean effect of RSCE on the slope of the general regression curve is 0,003185. This means that an increased efficiency of relational and structural capital produces an increase in the slope of the curve. Put differently, the indicator $TIME * C_ERSC$ signals that over time the interaction effect of relational and structural capital efficiency on club performance (score) would tend to increase. A possible explanation this is that, while in the professional football sector the efficiency of relational and structural capital *in general* does not impact significantly club performance, in the medium term the interaction effect of relational and structural capital on club performance would tend to increase over time. This is arguably due to the fact that investments in relational capital by their very nature usually do not yield immediate economic returns: in fact economic returns only materialize over time to the extent that market relationships become established and grow. In turn, the increases in economic returns (revenues) from customer capital augment the spending power of clubs in playing talent, which might explain our findings that relational capital efficiency impact positively sporting performance in the medium term.

4. Research summary and limitations

In the current phase of economic evolution, a major source of a firm's competitive advantage lies in its intangible assets. It is therefore commonly held that investments in intangible assets affect positively business performance.

This paper has put to empirical test this contention by exploring the impact of intangible assets on performance in the context of professional football business. Specifically, we aimed to assess whether intangible assets such as intellectual capital had an impact on club performance expressed in terms of points in the League standing. In order to do so, we have used the statistical technique known as mixed-effects linear regression model for longitudinal analysis.

The empirical test has been performed on a sample of professional football clubs playing in the top-flight division (Serie A) of Italian football. The data set covers a time period of five years and namely the sporting seasons from 2007 to 2012. In order to provide a balanced data panel, we chose to include in our sample only those clubs which have never been demoted from the top-flight division (Serie A) in the time period being considered.

In order to provide measures of intellectual capital, we have used as a framework the VAIC model proposed by Pulic, which is intended to measure the intellectual capital efficiency (ICE). However the VAIC coefficient as put forth by Pulic appeared not to be very suited to measure the ICE in the peculiar business of professional football; therefore, by making some adaptations to the original model, we have provided two specially-devised efficiency measures referred to above as HEC (Human Capital Efficiency) and SRCE (Structural/Relational Capital Efficiency).

Based on a theoretical distinction between the technical area of club management (and the related investments in human capital) and the administrative area (and the related relational and structural capital), it has been explored the impact of HCE and SRCE indicators on the sporting performance (measured as relative scores) achieved by the clubs in the sample.

In the light of the results from the statistical processing of data, one might conclude that for the clubs in the sample, as regards the time period under consideration, an increase in the human capital efficiency affect positively sporting performance. However, this positive impact interaction has been found to fade over time, as shown by the (mean) effect of the EHC indicator on the slope of the general regression curve. As already noted, this result might be explained as due to the fact that the competitive position of a club is primarily determined by its human capital (meaning the players in squad), which however implies ongoing investments in playing talent if the positive impact on performance is to be sustained over time.

Instead, as regards the interaction of structural/relational capital, it has been found that an increase in the investments in relational/structural capital has virtually no impact on sporting performance at least in the short term; while in the medium term a positive association has emerged between the efficiency of relational capital and sporting performance. This result has been explained as due to the fact that in general the relationships with external stakeholders take time to develop and therefore they yields returns in both economic and sporting terms only in the medium-to-long term.

Taking together all the findings from this study, we are led to conclude that intangible assets investments can impact positively football club performance. Results from statistical analysis appear to lend support to this contention, especially as regards investments in technical area; though, in the medium-to-long term it might hold true for the administrative area too. This stands to suggest that investments in intangible assets are

a significant consideration in both the technical and administrative area of football club management.

It is no doubt that the findings and conclusions from this study suffer from many limitations that could, at least to some extent, be overcome through further research. In particular, it would be valuable:

- To extend the time horizon of the analysis;
- To extend the analysis to tangible assets
- To replicate the study on foreign Leagues.

Structured Abstract

Purpose – The recent increase in patenting by European and American university researchers has raised concerns by observers asking whether increased patenting is associated with less open publication of their research results. This leads us to examine if the propensity to academic patenting would affect publication of scientific research results and, therefore, cause a lower diffusion of knowledge resources; or, conversely, if it could improve academic performances by increasing quantity and quality of scientific publications.

Design/methodology/approach – We propose a quantitative approach through which we aim to test whether academic researchers who both publish and patent are less productive than their peers who concentrate exclusively on scholarly publication in order to communicate their research results. More specifically, by using the statistical model of comparison between sample means – we analyse if the average number of academic inventors publications is lower than those of non-academic ones. We use a panel dataset comprising Italian academic researchers who have obtained the National Scientific Qualification as full professor in the sector “02/B3–Applied Physics”, in the session 2012.

Originality/value – With regard to the relationship between patenting and publishing by university researchers there is not an unanimous doctrinal orientation. Additionally, there is only limited empirical evidence regarding the correlation between these two variables. Our study contributes to the existing literature by supporting the thesis according to which the open publication of university research results is not inhibited by patenting by university faculty members.

Practical implications – The outcomes of the application suggest that it would appear appropriate to encourage a greater use of patents by university researchers. It would seem, in fact, that – thanks to the financial support to academic research and, in general, to the

¹ *Even though the work is a result of the combined effort of the Authors, paragraphs 1 and 4 have been developed by Emanuela Palumbo, paragraphs 2 and 3.3 by Tiziana Buttarò and paragraphs 3.1 and 3.2 by Bruno Marsigalia.*

incentives arising from contact with industry – the development of industrial applications is likely to produce an additional stream of results, which are relevant also in the eyes of the scientific community. These observations allow us to assert that patents could be recognized as efficient indicators of knowledge production.

Keywords – Intellectual capital, scientific productivity, academic patenting, technology transfer

Paper type – Practical Paper

1. Introduction

The strategic importance of intangible assets for a company's success is widely recognized. This importance has only grown in the recent years due to the increase in international economical competition and to development of what is commonly known as the knowledge economy (Bosworth and Webster, 2006; Edvinsson and Malone, 1997; Foray, 2006; Ghidini, 2009; Lev, 2003; Rifkin, 2001; Rullani, 2004; Stewart, 1999; Sveiby, 1997; Trequattrini, 2008; Zanda, 2009). Particularly, knowing that the competitive advantage amongst different economies is basically related to the efficacy of implementation of the innovative system has lead the economists to pay special attention to the role of science as one of the main *input* to generate growth within an economical system (Romer, 1990).

In that context, it is widely known the crucial role of Public Research Institutions (PRI) and especially of the universities, which play into the technological transfer of knowledge by the appropriate endorsement of the scientific research (Cicchetti et al., 2007; Lazzeroni, 2004; Mansfield, 1991; Mansfield, 1995; Mansfield, 1998; Narin et al., 1997; Piccaluga, 2001).

Thus, in the latest years a gradual process of transformation of universities has happened. Nowadays, they have developed new functions due to a greater open-mindedness towards the external environment and to the growing desire to satisfy research needs and to offer new educational services within their economic and social system (Bonaccorsi, 2000; Godin and Gingras, 2000). There are new activities of technological transfer towards private firms that have been implemented, as well as the more traditional activities made by the universities, such as the delivery of technical and scientific knowledge and the development of competence.

The *Triple Helix Model* (Etzkowitz and Leydesdorff, 2000) is a representation of that “entrepreneurial” function. According to this model, the development of technological innovation is a collective and localized activity (Antonelli, 1999) that requires a synergic co-operation between universities, the industrial world and institutional players. In fact, reading the actual economical scenarios through the items and variables that is possible to represent in that model, universities would assume a third mission (in addition to the traditional researching and educational activities) to participate in the economical national growth and particularly in their home region. Thus, a new educational model has developed the “entrepreneurial university”.

To better understand the numerous structured activities implemented by the universities to deliver technological transfer, it is possible to examine the kind of knowledge and players involved (Baglieri, 2008).

According to the traditional classification made by Polanyi (1958), knowledge can be considered as codified knowledge – very easy to transfer thanks to a formal language used (the code) – or as tacit knowledge, held by the producer and therefore it is more difficult to be transferred and reproduced in different context, gathering to the contextual knowledge.

With special regard to the actors involved, the technological transfer can be started by the university throughout its direct relationships with companies or by the individual professors.

When the result of the research is a tacit knowledge and the actor involved is the university, the process of adding value to it (also a commercial value) happens through the foundation of *spin-off* companies, whose share could also partially belong to the university itself; on the other hand the process of value diffusion happens through personal contacts. Basically, that is the hypothesis when the researchers change the academic institution to whom they belong and go to physically follow the pattern of their own results obtained or when the industrial researchers stay for long periods into the laboratories where the researches undertaken by the firms take place.

Meanwhile, when the technological transfer is promoted by an individual professor those consulting activities bring some benefits to the university. The increase in internship opportunities and employment for the graduate students, as well as the chance to strengthen the scientific production indicators, are only some of the advantages for an academic institution that the university can exploit.

When the results of the research mainly belong to the type of codified knowledge, the process of value adding made by the university can be patented and eventually transferred by an exclusive or non-exclusive contract of licensing.

In contrast, an individual professor can implement the knowledge diffusion mainly through publications and presentations to the conventions.

It is particularly useful then to analytically analyze the individual level of professors' results. The Italian legislation about university patents allocates to the researcher, rather than to the university, the exclusive ownership of the royalties from the invention patented (D.Lgs. February 10, 2005, no. 30, art. 65).

That represents a preferential treatment when compared with existing regulations in other European countries. In fact, France, Germany and Great Britain have chosen to allocate the property of the royalties to universities, to endeavor to reduce the differences between private and public academic institutions and also between the professors themselves. That effort is inspired to the Bayh-Dole Act (USA, 1980) that promoted the possibility for universities to manage the royalties and copyrights and to collect the profits given by the licenses (Henderson et al., 1998; Jaffe, 2000).

The Italian law appears to support that "privilege" to incentivize the researchers in patenting their inventions.

All these matters suggest some main consequences.

First of all, the universities that aim to develop the local economical growth have to implement the technological transfer activities using several instruments and systematic procedures.

In addition, most of the transfer activities require the legal protection of a patent. Also within the range of the non-formal knowledge transfer there is the possibility to apply for some patents. For instance, even the constitution of spin-off companies (technological transfer of tacit knowledge) is based on the transfer of a patent – codified knowledge – to protect the inventor (Cesaroni and Gambardella, 2001).

On the other hand, the results of professor's cooperative researches could lead to patents owned by the partner enterprise and by the professors. In this case, the professors will be listed amongst the patent's inventors. That is the *inventorship* process.

Because of those considerations and the growing demand by the European and American universities to register patents, we are using the university patents as a significant index of knowledge production.

In the following paragraph we will glance at the literature's view on the consequences that patents on academic research have on scientific progress. The purpose is to analyze if either the attempts to patent techniques and tools that are used in the scientific research will emphasize the knowledge production and diffusion; or per contrary whether it would be a limit to scientific progress, due to the rising costs of research.

The third paragraph will demonstrate the reliability of university patents as a proxy for knowledge production activity, throughout a quantitative analysis of the Italian market. It will then illustrate the statistical methodology applied to the sample and its characteristics and resulting data.

Finally, the fourth paragraph presents the conclusions, focusing on both its limitations and the research evolutions that can be done.

2. Literature review

This section aims to investigate the effects produced by academic patenting on scientific research. The purpose is to analyze whether patents enhance the production and transfer of knowledge or represent a limitation to the scientific progress. The second hypothesis considers scientific process as a cumulative kind of process, thus, it has to be based on the free access to the stock of existing knowledge.

Part of the literature supports the theory that scientific progress is a collective and cumulative enterprise (Behrens and Gray, 2001; Blumenthal et al., 1986; Cohen et al., 2002; Dasgupta and David, 1994; Geuna, 2001; Krimsky, 2003; Lee, 1998). That means the research tools – laboratory equipment, experimental procedures, measurement tools – developed by scientists are fully available for others researchers, that can easily refer to the results obtained by their colleagues' work, in order to add innovative results to the former researches. Instead patenting could restrict the access to the research's results, so to affect the effective production of knowledge. The exclusive use of research tools by those scientists that invented them and own the exclusive licenses, could slow down the scientific progress and, therefore, the total amount of discoveries.

Heller and Eisenberg (1998) suggested that since the end of 1980s patenting has moved firstly within biomedical research. They pointed out that the intellectual property of tools is fragmented in many patents held by several owners, causing a multiple overlaps and concatenations between them. This phenomenon is known as a *tragedy of*

the anti-commons: the researcher has to require several licenses to access to the common pool of scientific discoveries necessary to deepen his research. The negative effects would be enhanced by the diffusion of the so-called *reach-through license agreement*, that allows the owner of a patented invention to preserve the rights on downstream discoveries around basic inventions.

Murray and Stern (2007) developed an experiment to test the anti-common hypothesis. Their study is based on the concept of dual knowledge, in which a single discovery may contribute to both scientific research and useful commercial applications. A key implication of dual knowledge is that it may be simultaneously instantiated as a scientific research article and as a patent. Such patent-paper pair is at the heart of their empirical analysis. The authors exploit the fact that patents are granted with a substantial lag, often many years after the knowledge is initially disclosed through paper publication. The knowledge associated with a patent paper pair, therefore, diffuses within two distinct intellectual property environments – one associated with the pre-grant period and another after formal IP rights are granted. Relative to the expected citation pattern for publications with a given quality level, anti-commons theory predicts that the citation rate to a scientific publication should fall after formal IP rights associated with that publication are granted. Employing a differences-in-differences estimator for 169 patent-paper pairs (and including a control group of publications from the same journal for which no patent is granted), they find evidence for a modest anti-commons effect (the citation rate after the patent grant declines by between 9% and 17%). This decline becomes more pronounced with the number of years elapsed since the date of the patent grant, and is particularly salient for articles authored by researchers with public sector affiliations. Some other surveys arrive to the same conclusions (Sampat, 2004).

Another disadvantage associated with the protection of the scientific research results would be the inventors' attitude to replace publishing with patenting. An assumption widely accepted by the scientific community claims that the youngest researchers need to firstly enforce their intellectual capital. Thus, if starting the career protecting their scientific output, they risk to be less productive in the future time; in contrast the older colleagues, thanks to the previously accumulated knowledge, would be able to devote themselves to patent the results of their efforts (Beraldo, 2007). That consequence, together with the slowing down of publications, would lead to a quality depletion.

Henderson et al. (1998) compared the amount of university patents between 1965 and 1988 with a random control sample equals to 1% of patents granted by the *United States Patent and Trademark Office – USPTO*. The authors also measured the *generality* and the *importance* of university patents for the control sample. The generality index measures the number of technological classes in which a given patent is cited, while the importance index takes into account the number of citations received. The results show that university patents are more important and more general than controls along the period analyzed. However comparing generality and importance of university patents with controls decreased after the introduction of the *Bayh-Dole Act*. That reduction has been due to two factors: 1) the BDA would induce patenting even smaller universities, whose research and inventions are not original; there would be also a reduction in the average quality of patents of larger institutions, with a considerable increase of patents that do not get any citations.

Finally, another disadvantage of academic patenting would lie on the shift of resources allocated to basic research towards more “attractive” applied research, sacrificing activities of medium-long term. While some fields do not express a distinction between basic and applied research (biotechnology), some other fields could be affected by relevant consequences, such as the physical shift of resources.

On the other hand, part of the doctrine agrees with the assumption that patents do not constitute a limitation to the production and dissemination of knowledge for several reasons, but rather an effective boost for the scientific research.

Firstly, a possible consequence of applying for a patent is that academic scientists become acquainted with researchers in companies. As these acquaintances develop into relationships, it is expected that industry contacts might become sources of ideas for new research projects (Azoulay et al., 2009). In fact, academic researchers report that problems they work on in academic research often come from ideas and problems encountered during industrial consulting (Mansfield, 1995). Another survey of scientists reported that 65% of researchers reported that interaction with industry has influenced their research. One respondent commented: “There is no doubt that working with industry scientists has made me a better researcher. They help me refine my experiments and sometimes have a different perspective on a problem that sparks my own ideas” (Siegel et al., 2003). This involvement and feedback may produce additional publications, and

potentially additional patents. As Agrawal e Henderson (2002) highlighted «*most patentable research is also publishable*».

University researcher involvement in commercialization activities may also provide additional information to the researcher about the value of various research streams. Research grants and consulting have, and continue to, serve this purpose in many academic settings. Additional exposure to and interaction with commercialization and industry may supplement these other indicators (Feller, 1990).

In addition, there is a natural analogy to the complementarities observed between applied and basic research in industrial firms. Rosenberg (1998), for example, documented that innovations born out of contact with commercial enterprises in the applied field of chemical engineering ushered a new era of basic discoveries in chemistry.

Yet, scientific publications are indicators of explicit knowledge generated in research and development stages of innovation (Cicchetti et al., 2007). Therefore, part of the doctrine believes that if the patents number is positively correlated to the scientific publications, the patent would be considered as a tool to promote the production of new knowledge.

With that regard, Markiewicz and Di Minin (2004) found that between these variables may exist a positive relationship due to two main reasons: 1) publications may serve as a type of advertisement, increasing the awareness and knowledgability of the relevant scientific community with regard to the patented technology. This can raise the value of the patented research because it increases the legitimacy of the technology and creates a set of researchers who know about it and may be interested in utilizing the patented research; 2) patents and publications may be positively correlated without being causally linked. If “good” researchers produce more and better research output, then these researchers will have more patents and publications.

Similarly, if the work of a researcher develops or improves over time, then the researcher may increase both patents and publications. Thus, the fact that higher numbers of patents and publications are both indicators of researcher quality suggests that a positive correlation would hold.

One could also imagine that patenting, and the associated possibility of licensing and industry involvement, would allow a university researcher access to additional funding (either from licensing revenue or industry funding) that he could spend on his research and lab expenses. The respondent quoted above also stated: “Also, my involvement with

firms has allowed me to purchase better equipment for my lab, which means I can conduct more experiments” (Siegel et al., 2003). The additional funding could allow for additional equipment, researchers, and junior faculty members, all of which could contribute positively to the publications and patents produced by the lab. This “pyramid effect” of patents and publications produced under the supervision of a university researcher whose name appears on many of the patents and publications generated complicates the interpretation on a positive correlation between patenting and publishing.

Finally, patents would be a source of information because of the recognition of the citations’ number as an indicator of knowledge *spillovers* phenomena. In fact, a patent generally quotes a certain number of previous patents and scientific publications, to whom the invention is connected. Just the citations’ number received by a patent is, according to some important studies (Harhoff et al., 1999; Jaffe et al., 1993; Jaffe and Trajtenberg, 1996; Jaffe and Trajtenberg, 1999; Jaffe et al., 2002), a significant indicator of its commercial value. In other words, patents can be weighed on the citations’ number received by future patents. Therefore, patents have an important explanatory function as information about them which are published may be used by several people, as well as by the inventor, to be updated on the state of the art (Grupp and Schmoch, 1999).

The idea for which patents would represent a stimulus to the production of cognitive resources leads us to focus attention on some empirical studies, which – although in limited number – have tested the ability of patents to generate knowledge by analysing the existence of a *trade-off* at the individual level between patenting activity and scientific publications.

These empirical analyses have followed so far common methodologies and provided essentially similar results.

Agrawal and Henderson (2002) explore the degree to which patents are representative of the magnitude, direction, and impact of the knowledge spilling out of the university by focusing on *MIT– Massachusetts Institute of Technology*, and in particular on the departments of *Mechanical Engineering (ME)* and *Electrical Engineering and Computer Science (EECS)*. Drawing on both qualitative and quantitative data, they show that patenting is a minority activity: a majority of the faculty in the sample considered never patent, and publication rates far outstrip patenting rates. Most faculty members estimate that patents account for less than 10% of the knowledge that transfers from their labs. Their results also suggest that in two important ways patenting is not representative of the

patterns of knowledge generation and transfer from MIT: patent volume does not predict publication volume, and those firms that cite MIT papers are in general not the same firms as those that cite MIT patents. However, patent volume is positively correlated with paper citations, suggesting that patent counts may be reasonable measures of research impact.

Calderini and Franzoni (2004), draw on bibliometrics, biographical and patent data of a sample of 1.323 Italian public researchers in the field Engineering Chemistry and Nanotechnology for New Material Sciences along 30 years (1971-2001). They measure scientific performances in each year as: a) the number of publications in that year and b) the quality of the publications, given by the average Impact Factor of the journals where the researcher published his/her work. Results of descriptive statistics and panel data analysis showed that patenting is never detrimental to quantity and quality of publications. The study suggests that scientific performances of scientists are likely to increase in the proximity of a patent event: panel data estimates seem to indicate that patenting is likely to generate a temporary increase in the number of publications, with no decrease in expected quality. Additional publications are made in the biennium of patent priority and, above all, in the following one.

Markiewicz and Di Minim (2004) compare a sample of 150 academic inventors and an equivalent sample of non-academic inventors employed in different sectors from 1975 to 1995. The results presented in their study suggest that the open publication of university research results is not inhibited by patenting by university faculty members: the annual number of publications by a faculty member increases following application for a successful patent, controlling for field, year, and time profile of publications by matched non-inventors. A doubling in the number of patents by a researcher is associated with a 5-10% increase in annual publications.

That tendency is confirmed by Breschi et al. (2007), who found that start to patent implies an increase of scientific productivity of about 15%.

Meyer (2005) examines for the field of nanoscience and nanotechnology whether researchers who both publish and patent are more productive and more highly cited than their peers who concentrate on scholarly publication in communicating their research results. His study is based on an analysis of nano-science publications and nanotechnology patents of a small set of European countries (Belgium, Germany, United Kingdom). While only a very small number of nano-scientists appear to hold patents in

nanotechnology, a considerable number of nano-inventors seem to be actively publishing nano-science research. Overall, these co-active individuals appear to outperform their solely publishing, non-inventing peers in terms of publication counts and citation frequency.

Azoulay et al. (2009) examine the influence of faculty patenting activity on the rate, quality, and content of public research outputs in a panel dataset spanning the careers of 3.862 academic life scientists, all of whom have been employed at U.S. universities or public research institutions between 1968 and 1999. They find that academic scientists who patent are more productive than otherwise equivalent scientists that are not listed as inventors on patents, but that publication quality appears relatively similar in the two groups. So they find that patenting has a positive effect on the rate of publication of journal articles, but no effect on the quality of these publications.

An important result of Italian data (Breschi et al., 2005; Breschi et al., 2007) presents two different types of academic inventors, «occasional» and «persistent», that behave differently towards patents and publications. Occasional inventors are scientists who patented only once in the course of their career. They increase the publications normally a couple of years preceding the patent and one following year. Persistent inventors are those that patented at least twice in their career. Their publications have a positive and continuous effect from the patenting activity even three years after the first patent.

In line with the aforementioned empirical studies, this paper aims to analyze the impact produced by scientific patenting on academic publishing activity.

3. The empirical analysis

3.1. Methodology

In this section the effectiveness of university patents as tools used to measure performance related to the production of new knowledge will be tested by verifying the existence of a correlation at individual level between patents and scientific publications, using data referring to the Italian context.

The reasons underlying this analysis are different.

First, an academic scientist could allocate their energies towards more economically profitable activities and, therefore, devote the majority of their time to patenting or to the

development of patents whose applications have already been filed. This could reduce the effort in terms of scientific publications.

Second, patenting of scientific output may cause a delay in the publication to not invalidate the patent, together with the affixing of restrictions on the dissemination of scientific results. This problem is particularly felt in Europe, where the researcher wants to patent his scientific output can not rely on the so-called *grace period*, which in the United States allows to publish research results aimed to patenting up to 12 months prior to the submission of the patent application, without this invalids the novelty requirement of the latter.

Finally, the results of the study are useful to understand if a greater propensity to patenting can change the orientation of academic research, moving it towards more specific and applied aims at the expense of general and theoretical ones. This change could cause a shift from academic basic research to applied research and, therefore, it could prevent patents from being recognized as efficient indicators of knowledge production.

Below the statistical methodology used, the characteristics of the sample under study, and the results observed will be exposed.

The empirical study has been conducted to test the hypothesis for which the productivity of academic inventors, in terms of scientific publications number, is not divergent from the non-academic inventors one.

In other words, we aim to understand if propensity to academic patenting could affect the publication of scientific research results and, therefore, lead to a lower diffusion of cognitive resources; or, conversely, if it represent a tool to improve their academic performances by increasing the quantity and quality of scientific publications.

The analysis has been conducted by comparing two samples: a sample of academic inventors – academics who hold at least one patent or one patent application – and a sample of academics with similar characteristics, but they never patented any results of their scientific research.

In order to test the above hypothesis we have used the statistical model of comparison between sample means, referring to the average number of publications produced by each sample. The number of scientific publications of each academic is computed with reference to a period common to the components of both samples.

The result obtained has been subjected to a test of significance to estimate his reliability.

3.2. Sample characteristics and data

The empirical investigation has been conducted with reference to academic researchers who have obtained the National Scientific Qualification as full professor in the sector “02/B3 – Applied Physics”, in the session 2012.

Participants number to the procedure in this area is equal to 280 academics, from which we have selected only 70 faculty members: those who have obtained the above qualification.

In particular, the sample consists of 31 academic researchers inclined to patent their research results – as holders of at least one patent or one patent application – and 39 academics researchers who do not patent any results of their scientific output. These two groups are the samples object of study.

Although they have not important dimensions, both samples can be considered significant because:

- most of academic inventors holds a number of patents or patent applications exceeding 1;
- in the other sectors it has not been possible to identify a significant sample of academic inventors, also because of the small number of participants who have obtained a favorable judgment to qualification.

In order to compute scientific publications number we have considered the period 1997-2012, as common to all academics of both samples. Consequently, the total number of publications of each faculty member has been purified from those previous the period in question.

The data related to both samples are contained in the following tables (table 1 and table 2):

Table 1 – Number of scientific publications made by academic inventors qualified as full professor in the area “02/B3 - Applied Physics”. Years 1997-2012.

So, we have tested the following research hypothesis:

HP. The average number of academic inventors publications differs from the average number of non-academics inventors ones.

In the following table (table 3) some summary statistics referring to both samples are reported.

Table 3 – Descriptive statistics of academic inventors and non-academic inventors

<i>Samples</i>	Academic Inventors	Non-Academic Inventors
<i>Minimum</i>	20	20
<i>Q1</i>	76	72
<i>Mean</i>	122,677	109,282
<i>Median</i>	107	103
<i>Q3</i>	164	137,5
<i>Maximum</i>	328	250
<i>Standard Deviation</i>	61,947	51,047

The analysis of the descriptive statistics shows that the two sample means do not differ substantially, being the relative difference of only 13publications.

The degree of reliability of the observed difference is confirmed by the test value.

By assuming the two analyzed samples have the same variance (homoscedasticity assumption) and setting a significance level $\alpha= 5\%$,the empirical evidence leads to the rejection of the research hypothesis ($t =0,992$; $p\text{-value} = 0,3247$), as we can deduce by the following table (table 4):

Table 4 – Test on the average values between academic inventors and non-academic inventors

<i>Samples</i>	Academic Inventors	Non-Academic Inventors
<i>Sample size</i>	31	39
<i>No. of average publications</i>	122	109
<i>Standard error</i>	9,020	8,174
<i>t-value</i>		0,992
<i>Degrees of freedom</i>		68
<i>p-value</i>		0,3247

So, it is reasonable to assert that the propensity to patenting does not appear to inhibit the publication of academic research results and, therefore, cause a lower diffusion of scientific knowledge.

3.3. Discussion of results

The quantitative study we have proposed has considerably reinforced the theoretical strand corroborating the assumption that university patenting could positively influence academic research.

The results observed, in fact, do not confirm the lower productivity of faculty member involved in relationships with industry, being the average of their scientific publications higher in number – even if to a limited extent – with respect to that of their non-inventor colleagues. Moreover, the higher number of academic inventors scientific publications clearly emerges also from the other summary statistics values.

The explanations for which academic patenting would increase incentives of researchers to produce and publish rapidly their results research may be different.

First, as Azoulay et al. (2009) pointed out, the market for university inventions is rife with asymmetric information. Academic discoveries often require years of additional development to yield marketable products; there is likely to be a great deal of uncertainty surrounding the commercial and scientific merit of discoveries at this primitive stage; and exhaustive due diligence regarding the value of a discovery is costly. Because of these information problems, is reasonable to believe that scientists' reputations are essential in the market for university technology: an academic researcher's scientific reputation is his/her most important currency in the effort to capitalize on intellectual property in the

market for university-originated technology. By acting as a signal of invention quality, the prominence of a patenting faculty in the community of science diminishes the search and screening costs that potential licensees must incur in the process of identifying promising university technology. Furthermore, university technology transfer officers are aware of the certification role of scientific eminence. Other things equal, because the discoveries of prominent scientists are more marketable in industry, TTOs are more likely to choose to file for patents on the discoveries of high-status scientists. Therefore, the ex post search, screening, and contracting problems in the market for ideas increase faculty's ex ante incentives to maintain their reputation on the scientific labor market, as doing so enhances both the odds of finding an industrial match for their inventions, and the value of their patents conditional on a match.

Second, the presence of the option to patent would not reduce scientists' incentives to invest in the production of public science thanks to the increased financial resources (as a result of increased licensing and royalties) that could be allocated on a discretionary basis perhaps to foster a new area of research or to develop new teaching opportunities – both of which are usually difficult to finance from traditional funding (Geuna and Nesta, 2003). Useful commercial discoveries often lead to industrial sources of funding for the laboratory of the patenting scientist. Even without access to new pools of knowledge, the ability to hire additional post-doctoral scientists or graduate students might result in higher scientific output for a scientist's lab. A related point is that many seminal scientific achievements have been made possible only by technological advances in instrumentation. In the biomedical fields and other areas of science, technological and scientific advances are therefore interdependent: new understandings are often beholden to progress in instrumentation. If patenting scientists are more likely to be in a position to negotiate access to state-of-the-art equipment in corporate laboratories (Owen-Smith and Powell, 2001), or if they are more likely to have developed the technical expertise to understand and modify research equipment, complementarities between the capital stock of their laboratory and that of their industrial partners might also increase publication output.

Finally, the idea for which the propensity to academic patenting does not seem to affect the incentive or ability of scientists to contribute public advances to the scientific literature is supported by the likely achievement of economies of scope that emerge when a scientist is involved in the development of both academic and commercial science. The

possibility of within-scientist economies of scope is also consistent with evolutionary theories of technological and scientific progress in which major advances are understood to represent insightful combinations of disparate pieces of knowledge (Hull, 1988; Weitzman, 1998). Insofar as access to diverse information facilitates the development of new and fruitful lines of scientific inquiry, patenting may facilitate the creation of the professional ties that productively broaden researchers' information networks. It would seem, therefore, that ideas might simultaneously have high scientific value and important commercial potential (Stokes, 1997).

4. Conclusions

Access to university-based research knowledge is critical for innovation in many industries. As patenting by university researchers has grown, observers are asking if that is associated with fewer open publications and research.

The economic theories are not unanimous about the relationship between patenting and publishing by university researchers.

Some of the economists support the theory that universities that strengthen patents would affect negatively the academic institutions themselves. A scientific output protection, would have a negative impact on "free knowledge", because of a higher level of secrecy, a slowdown in publications and more boundaries to access to scientific information about the research activities.

On the other hand, the alternative view suggests that patents are not a tool to prevent the production and diffusion of knowledge, but rather an effective boost to scientific research. Basically, the interaction with industry could enhance research and spark new research ideas. Funding from industry sources and money from licensing revenues may help researchers to implement additional research activities, to hire researchers, and to purchase new lab equipment. It is widely recognized that «*the biggest money comes from industry in return for collaborative research*» (Etzkowitz, 1998). Furthermore, it is possible that the enterprises, even before receiving the industrial funds, will already be selecting the most proactive and dynamic researchers. Thus, the faculty members would be encouraged to publish the results of their scientific researches.

Regarding the relationship between patenting and publishing by university researchers there is a limited amount of empirical evidence: the results of the studies we have

analyzed found that academic inventors are more likely to belong to the group of the most scientifically productive professors.

Our research contributes to the existing literature by providing an empirical investigation of faculty patenting and publishing with a dataset containing academic researchers who have obtained the National Scientific Qualification as full professor in the sector “02/B3 – Applied Physics” (session 2012).

This paper suggests that the open publications of university research is not inhibited by patenting of faculty members. In fact, the analysis found that the average number of academic inventors’ publications is higher than non-academic inventors. Thus, the results do not confirm the hypothesis of lower productivity of faculty members involved in patenting activities.

The results suggest it would be appropriate to encourage a greater use of patents by university researchers. It appears that thanks to the financial support to academic research and to the incentives brought by the industry, the development of industrial applications is likely to produce an additional stream of relevant results for the scientific community. The results of the survey suggest that patents have to be recognized as a significant indicator of knowledge production.

The survey suffers some limitations that could be filled by further insights. Particularly, we state once again that the comparison between sample means has been carried out in a single industry; therefore, future developments of that research could take place starting from different industries to be analysed. Moreover, the analysis is exclusively quantitative and it does not refer to the qualitative academic publications’ outcomes.

Nevertheless, the open-mindedness of universities towards technology transfers deserves further consideration. If that trend were to be overexploited it might bring some negative consequences. In fact, it is worth remembering that universities are mainly meant to produce knowledge available to everyone, throughout publications and mobility of researchers. That happens also thanks to a continuous transfer of information and experiences allocated in a network structure (Beraldo, 2007). If academic researches’ outcome were patented “at the beginning” it would generate a risk to “deform” one of the most important sources of knowledge production.

Structured Abstract

Purpose – The objective of this paper is to examine the relationship between some aspects of governance (such as ownership structure and characteristics of the board), the efficiency of intellectual capital and the economic and market performance of a sample of Italian listed companies.

Design/methodology/approach – This study investigates a sample of forty Italian listed companies during the period 2002-2012, whose shareholder weight is equal to approximately 50 percent of the total market capitalization. In particular, through regression analysis there will be an examination of the relationship between economic and market performance and the efficiency of intellectual capital, the characteristics of the board and the ownership structure of the companies investigated. In addition, a few control variables (debt ratio, size, industry and firm age) will be used to measure the impact on the regression analysis.

Originality/value – This methodology highlights both the relationship between the efficiency of intellectual capital and the performance of firms and the influence that the governing body can have on the efficiency of intellectual capital. The research on the one hand extends the existing literature on some aspects of corporate governance and intellectual capital; on the other hand it aims to test the importance of the ownership structure and the characteristics of the board of directors as a means of creating value in firms.

Practical implications – The outcome of the application, in addition to enhancing knowledge on the relationship between ownership structures, the characteristics of the board, the efficiency of intellectual capital and business performance, intends to determine if the board of Italian listed companies affects the determination of business results and the management of intellectual capital. Moreover, the results could be useful

both for policy makers in order to regulate the size of the boards and their independence with respect to the ownership, and also for enterprises in determining compensation and benefits.

Keywords – Intellectual Capital, Ownership Structure, Board Structure, Firm Performance, Italian listed companies

Paper type – Academic Research Paper

The authors would like to thank Emanuela Palumbo and Francesco Di Vona for their support during the writing of this article.

1 Introduction

Alongside the more traditional vision based on financial structure (Modigliani and Miller, 1958), ownership structure (Jensen and Meckling, 1976) and the risk-return relationship (Sharpe, 1964) as determining factors in the analysis of the stock performance of companies, there has developed over the last twenty years a vast empirical literature aimed, on the one hand, at measuring the possible relationship between the efficiency of intellectual capital and economic performance, and on the other at verifying if the efficiency of intellectual capital is able to explain the difference between the market value and book value of listed companies. The objective of previous studies was to find additional information variables in the empirical analysis on the efficiency of stock markets (Fama, 1970) and, in particular, to demonstrate that Intellectual Capital Disclosure (ICD) may be useful in extending the flow of information that has an impact on the prices of securities.

In the literature there are two different strands of research regarding the relationship between the efficiency of intellectual capital and business performance.

The first focuses on the relationship between IC and performance, and most of these studies use patents, trademarks and R&D as proxies of IC (Edvinsson and Malone, 1997; Bornemann *et al.*, 1999; Aboody and Lev, 2000). More recently, the relationship has been investigated using the Value Added Intellectual Coefficient (VAICTM), a model proposed by Pulic (2000) as a proxy of the efficiency of intellectual capital.

At the empirical level, however, the results reported in the literature appear discordant. Some authors tested the VAIC and found a positive relationship with business performance (Chen *et al.*, 2005; Muhammad and Ismail, 2009; Clarke *et al.*, 2010;

Janosevic *et al.*, 2013), and yet others, instead, failed to find a significant relationship (Firer and Williams, 2003; Kamath, 2008; Ghosh and Mondal, 2009; Puntillo, 2009; Ferraro and Veltri, 2011; Celenza and Rossi, 2012a). In this context, there have been contributions aimed at verifying whether the VAIC used in conjunction with other variables improves the explanation of the market value of the share capital, and the results appear to be positive (Huang and Wang, 2008; Celenza and Rossi, 2014a).

The second strand of literature is more recent and deals with the relationship between ownership structure, corporate governance in general, and the efficiency of intellectual capital. The aim of this strand is to verify whether the efficiency of intellectual capital is affected by the ownership structure, thus indirectly shifting the focus on agency costs (Firer and Williams, 2005; Saleh *et al.*, 2009; Tsai *et al.*, 2013; Bohdanowicz and Urbanek, 2013; Celenza and Rossi, 2013b).

The objective of this paper is to fit within the second strand of studies and examine the relationship between some aspects of governance (such as ownership structure and characteristics of the board), the efficiency of intellectual capital and the economic and market performance of a sample of Italian listed companies.

2 Literature review

Over the last ten years, numerous empirical studies have investigated on the connection between corporate governance and the firm's performance, also with special regard to Intellectual Capital efficiency.

2.1 Intellectual Capital and firm performance

Several empirical studies demonstrate the impact of intangible assets on both the company's financial performance and stock returns. Aboody and Lev (2000) showed that the impact of generating IC on the current and future operating earnings was very strong. With reference to the chemical industry, for example, they showed that the increase in research and development (R&D) investments doubled the operating profits.

Bornemann *et al.* (1999) found that firms that manage their IC more effectively were able to secure a very strong competitive advantage over other companies and to perform better than them.

There is no single definition of IC. Stewart (1997), for example, defined IC as the "packaging of useful knowledge" (p. 67). Instead, Petty and Guthrie (2000) gave IC a

much more incisive meaning. They considered it instrumental both in determining the value of the company and in improving the economic performance of a nation. In the literature, there is also a widely-accepted idea of the existence of a strong relationship between IC and the market value of firms. For example, Lev and Zarowin (1999), Lev (2001), and Lev and Radhakrishnan (2003) focused on the gap between the market value and the book value of companies, while trying to investigate the invisible values that did not appear in financial statements. More generally, there have been hypotheses about the weight that IC can have on the value of the company and on the need to consider not only the financial variables but also the value of IC.

Edvinsson and Malone (1997), indeed, defined IC as the gap that is observed between a firm's market value and book value.

Marr *et al.* (2004) proposed an organizational approach based on the Knowledge Assets Map and the Knowledge Assets Dashboard. The introduction of the Knowledge Asset Map and Knowledge Asset Dashboard can help firms to identify their key knowledge assets. In particular, the knowledge asset dashboard stresses the important actor/infrastructure relationship and the dynamic nature of these assets.

Pulic (2000 and 2004) offered an additional measure of the value of IC through the VAICTM, which included both physical capital and human and structural capital.

Firer and Williams (2003) tested the VAIC. However, they failed to find a strong relationship with the company's profitability.

On the contrary, Chen *et al.* (2005) found that IC had a very strong impact on the market value and performance of firms. In particular, investments in R&D can provide additional information on structural capital and generate a positive effect on firm value and profitability.

Cabrita and Vaz (2005) investigated a sample of 53 Portuguese banks and found that IC is significantly correlated with the organizational performance of the banks and that the interaction between the components of the IC generates greater value.

Tan *et al.* (2007) investigated 150 companies listed on the Singapore Stock Exchange during the period 2000-2002 and found a positive relationship between the VAIC and financial performance in several sectors, including manufacturing. The results of the manufacturing sector would seem statistically more robust. The authors also divided the sample into three groups according to the values of the VAIC and found that groups of companies with higher VAIC values correspond to results which are positive and

statistically more robust than the values recorded by the companies with the lowest VAIC.

Huang and Wang (2008) investigated 37 companies listed on the Taiwan stock market (17 firms belonging to traditional industrial sectors and 24 to the electronics industry) during the period 2001-2003. The two authors used Ohlson's model by including in the model both the EVA[®] (Economic Value Added) indicator and intellectual capital in order to capture residual information. The two authors found that by including certain variables as proxy of IC the explanatory power of the regression model increases. In other words, the intellectual capital proxy, together with the EVA, provides incremental information for the evaluation of companies.

Kamath (2008), however, did not see any relation between IC and the traditional performance measures, such as profitability and market value. Even Ghosh and Mondal (2009), after investigating 80 companies operating in the pharmaceutical and information sector and testing the relationship between IC and company performance, found that market value and productivity were not significantly related to IC. However, they pointed out that IC was a good predictor of productivity.

Puntillo (2009) examined a sample of banks listed on the Italian stock market, but he failed to find a strong relationship between IC, ROI, and return on asset (ROA).

Muhammad and Ismail (2009) examined 18 Malaysian financial companies in 2007 and found a positive and statistically significant relationship between the VAIC and ROA.

Carlucci and Schiuma (2010) addressed the issue from another perspective and dwelt on the need to identify performance indicators to be placed in the perspective of an analytical network approach, as the selection of these performance indicators is one of the biggest challenges companies will have to face in order to develop an efficient system of performance measurement. The authors emphasized the importance of the interaction of the indicators as a guideline for decision makers.

Clarke *et al.* (2010) investigated a sample of Australian listed companies during the period 2004-2008 and found a direct relationship between IC and the performance (ROA and ROE) of companies.

Ferraro and Veltri (2011) investigated a large sample of companies listed on the Italian stock market through Ohlson's model and found that the variables of the IC did not show a significant relationship with the market value of firms.

Gigante and Previati (2011) investigated the Italian banking sector during the period 2003-2007, using stock returns as the dependent variable. The results obtained indicated a positive but not statistically significant relationship between equity returns, the VAIC and its components.

Maditinos *et al.* (2011) investigated the relationship between IC, market value and financial performance of a sample of 96 Greek listed companies during the period 2006-2008. The results are not in line with most of the hypotheses made, thus emphasizing the failure of the hypothetical relationship between IC and M/BV. However, they identify a statistically significant relationship between the efficiency of human capital and ROE.

Rehman *et al.* (2011) investigated 12 Pakistani companies and found a positive and statistically significant relationship between the components of the VAIC and the ROE.

Venugopal and Subha (2012) examined 41 firms producing software in India during the period 2000-2010 and found that, although the efficiency of capital employed and the efficiency of structural capital were both significantly and positively related to the financial performance, there was no direct relationship between the VAIC (served as an indicator for measuring IC) and the financial performance. Venugopal and Subha (2012) emphasized, however, that “the model which studied the relationship between components of VAIC and financial performance explained the firm’s value better” (p. 130).

Celenza and Rossi (2012a) examined a sample of 11 Italian listed companies during the period 2003-2008 and measured the relationship between VAIC and M/BV and between VAIC and the profitability indicators (ROI and ROE) and didn’t find a significant relationship between the variables.

Celenza and Rossi (2012b) proposed a methodology consisting in the construction of an adjusted multiplier based on a simplified version of the VAICTM. The adjusted multiplier is obtained from the product between the simplified VAIC and the ratio of the ROE of the firm to the ROE of the sector the firm belongs to. The algorithm allows a better illustration of the efficiency of the intellectual capital in a context of sectoral performances.

Javornik *et al.* (2012) investigated 12,000 Slovenian companies during the period 1995-2008 and found a positive and statistically significant relationship between VAIC, ROA and ROE and between the components of the VAIC and financial performance.

Janosevic *et al.* (2013) investigated 100 Serbian companies in 2010 and found a positive and statistically significant relationship between the ROE and the efficiency of capital employed and between the ROE and the efficiency of human capital.

Celenza and Rossi (2014a) investigated 23 Italian listed companies belonging to different sectors, during the period 2003-2008, and found no relationship between financial performance and the VAIC. However, they found a positive and statistically significant relationship between the changes in market value and changes in the VAIC and between changes in performance indicators (ROI, ROE and ROS) and changes in the VAIC, concluding that the VAIC improves the explanation of the regression analysis and assuming its utility as an “additional coefficient” in the analysis of equity performance.

More recently Celenza and Rossi (2014b) investigated the existence of a relationship between the efficiency of intellectual capital and the financial performance of Italian manufacturing firms in the period 2002-2011. The analysis was divided into three methodological stages. In the first stage the relationships between the M/BV and VAIC and between the financial indicators (ROI, ROE, ROS) and the VAIC were examined. The results suggest a positive and statistically significant relationship for both the ROI and the ROE. In the case of the M/BV, however, there is no relationship with the VAIC. The results obtained in the second stage, by rearranging the sample according to the values of the VAIC, point out a positive and more robust relationship between the variables examined, with the exception of the M/BV. In the last stage of the analysis the results suggest that the high VAIC portfolios record a higher average performance compared to low VAIC portfolios and that intellectual capital could be a discriminating variable in returns.

2.2 Ownership structure, board structure and firm performance

The problem of efficiency in the management of business resources has lead many researchers to study the phenomenon related to the agency costs stemming from the separation between ownership and control and therefore arising from the divergence of interests between principal and agent. Agency costs, like other costs, make businesses less competitive; it is therefore necessary to identify the monitoring mechanisms of managers' opportunistic behavior (majority shareholders) that may minimize these costs. Berle and Means (1932) were the first to examine the ownership structures of firms and in particular the problem of the separation of ownership and control, emphasizing the possible

divergence between the interests of owners (founders of the company) and those of the management that manages the resources.

Jensen and Meckling (1976) examined the agency costs caused by the possible opportunistic behavior of managers whose utility function may diverge from the interests of the ownership. They could manage the resources in an inefficient manner in order to maximize their utility function. Fama (1980), starting with the assumption that markets are fully efficient, emphasizes the importance of managerial resources as a monitor of managers' opportunistic behavior. If there exists a managerial market in which skills are traded, it is in the manager's interest not to depreciate his skills in order to avoid reducing his compensation and incentives. Thus a manager who does not maximize the firm's economic value undergoes a depreciation of its capabilities on the market of human resources.

Jensen and Ruback (1983) argued that the market for corporate control represents the largest component of managerial resources and therefore a manager who implements opportunistic behavior, violating the principle of the creation and maximization of value, could be replaced by the takeover.

Fama and Jensen (1983), however, point out that there is not necessarily a monotonically decreasing relationship between agency costs and the share held by managers. With the increase of the stake they own, managers could avoid their dismissal, as it becomes difficult for other managers to take over.

Demsetz (1983) does not believe that there is an appropriate ownership structure for all situations if the value of the firm's assets is to be maximized. As he writes: "The ownership structure likely to maximize the value of the firm's assets depends on the technology of the tasks required of the firm's labor force, on the desired scale of operation and on the managerial ability of potential owners of the firm. No single ownership structure is suitable for all situations if the value of the firm's assets is to be maximized. In particular, from the viewpoint of the owner(s), the optimal distribution of profits is 100 percent to a single owner-manager only in special circumstances" (p. 386).

Demsetz and Lehn (1985), after investigating 511 firms during the period 1976-1980 did not find any relationship between ownership concentration (OC) and the accounting profit rate.

Jensen (1986) believed that by reasoning in terms of free cash flows, the debt may limit any opportunistic behavior, thus ensuring greater efficiency. He argued that excess

cash resources should be distributed to the shareholders and removed from the discretion of managers who tend to reinvest them even in the absence of profitable investment opportunities.

Morck *et al.* (1988) studied the linear relationship between managerial ownership and performance on a sample of 371 U.S. companies in 1980 and found a significant non-monotonic relationship between the variables.

McConnell and Servaes (1990) analyzed the relationship between Tobin's Q, insider and blockholder ownership using two different cross-sectional samples in 1976 and 1986, respectively, and found a positive but decreasing relationship with the increase of OC for insider ownerships and a positive but non-significant relationship for the blockholders.

Cho (1998) examined 326 U.S. companies in 1991 by replicating the work of Morck, Shleifer, and Vishny (1988) and found a similar non-monotonic relationship between Q and the management shareholding. In the next stage, however, he found that Q affects the ownership structure but not vice-versa.

Demsetz and Villalonga (2001) investigated the relationship between Tobin's Q and the managerial ownership of 223 U.S. firms over the period 1976-1980 and found no statistically significant relationship between ownership structure and firm performance.

Faccio and Lang (2002) conducted a study on 5,232 companies in 13 countries in Continental Europe and found that firms are typically widely held for 36.93% and controlled by the family for 44.29%. On average, the relationship between ownership and control is very high and the pyramid control model is widespread in other countries as well.

Anderson and Reeb (2003) examined 403 U.S. firms over the 1992-1999 period and found that family firms represent a widespread pattern and perform better than or as much as non-family firms: the Tobin's Q for family firms is higher than in non-family firms.

Earle *et al.* (2005) analyzed 168 Hungarian companies listed in the period 1996-2001 and found that the size of the largest block increases profitability and efficiency strongly and monotonically. They used two performance measures (ROE and operating efficiency) and found that the second measurement is more significant than the ROE.

Barontini and Caprio (2006) studied the relationship between ownership structures and performance of firms in a sample of 675 listed companies in 11 countries in Continental Europe and found that the most widespread ownership model is the family

model and that this model is positive for the operational performance and the value of the firm.

Perrini *et al.* (2008) investigated a sample of Italian firms during the period 2000-2003 and found that the OC in the five biggest shareholders is beneficial to firm value. They indeed found a positive relationship between the top shareholders and Tobin's Q.

An equally large literature has developed on the relationship between the board and the performance of firms. In many studies there has been an examination of the relationship between the characteristics of the board (size, gender diversity, age, etc.) and performance, and in others the relationship between board compensation and performance. The board should play a monitoring role on the possible opportunistic behavior of the management (Fama and Jensen, 1983). For example, Hermalin and Weisbach (2003) analyzed the economic literature regarding ownership and the board's structure and how their characteristics can affect the firm's performance. They mention the notorious surveys which demonstrate that there is a negative relationship between board size and company profitability; and that both board compensation and size have a significant relationship with the main board decisions, such as the CEO replacement. Finally, they suggest that the board is "an institution that has arisen endogenously in response to the agency problem inherent in governing any organization" (p. 20).

Barontini and Bozzi (2009) investigated the relationship between ownership characteristics and the level of board compensation and firms' performance. The survey was conducted on a copious sample of Italian companies listed on the Milan Stock Exchange (1995-2002). With regard to the data investigated the authors applied a refined version of the total compensation, which is the "other compensation" a value net of the amount accrued in previous years to the directors.

The results are the following: the larger ownership concentration is related to the lower board compensation. On the controlling shareholder side, family firms give higher levels of compensation, thus supporting the rent extraction hypothesis rather than the social network theory. Moreover, the presence of shareholder agreement gathers an average higher compensation. The authors trace the evidence of a negative influence of higher board compensation on the firm's future performance. Finally, they analyze the effects of the separation between cash flow and voting rights.

Bianco *et al.* (2011) analyzed the relationship between ownership structure and the presence of women in the board of directors. They demonstrated that the number of

women on the board arises within public companies with a larger shareholder distribution or international companies, also with a higher percentage of younger directors. Information Technology and high-tech industries are the most characterized by the female presence on the board, together with the companies that have investment banks and funds in the corporate ownership.

The survey focused on the Italian market. It also aimed to trace a link between the presence of women on the board of directors and the company's performance and good governance; however the data didn't support those hypotheses. On the contrary, good governance can decrease when the women directors are relatives of the other members of the board, since the frequency of the meetings decreases.

Barontini and Caprio (2002) extended the empirical research that defined a connection between board turnover and firm performance to a sample of Italian companies listed on the Milan Stock Exchange (1976-1996). The authors followed the same methodology applied in the former survey on board turnover. The data that included takeover effects have been discarded because the work aims to show a normal functioning system.

A main governance characteristic of the Italian Market is a higher ownership concentration (53% of the capital is controlled by the main blockholder). Starting from that peculiarity, the different results with the former study occur. Therefore, Barontini and Caprio demonstrated that the board turnover of Italian companies is higher than abroad; thanks to a greater ownership concentration it is easier to dismiss inefficient directors. Moreover the survey shows that the connection between turnover and standard age doesn't have any empirical evidence, and that the average number of directors on Italian boards is lower than abroad.

Finally, the authors studied the link between board turnover and Italian firms' performance. The data supported that relation, but the variables are not so strongly related as in the results of the American and Japanese surveys. The main reason is once again the high level of OC which doesn't necessarily lead to read the results in terms of inefficient governance, but it could also be explained by the main shareholder's facility in persuading top management to change strategies, however inefficient, rather than having a turnover.

Belcredi and Rigamonti (2008) also based their survey on the Italian context, but they used a peculiar method of comparing the firm's data over time, taking into account only certain years (1978, 1988, 1998 and 2003). Over this period of time they observed the

changes in the board's structure, especially in order to identify the main causal connections between ownership structure and firm performance (calculated using Tobin's Q). They demonstrated that the connection between ownership and board structure is higher in Italy than abroad, since it is a country with a high OC level.

They also demonstrated the following results: the board structure of Italian listed companies has changed very sharply over that period of time; board size is directly related to firm size, while there is an inverse relationship with the cash flow rights of the main blockholder and company size; the separation of control rights has decreased since 1990.

Moreover the authors analyzed the board's composition: the proportion of non-executive directors increases in larger boards and when the role of Chairman and CEO are held by the same person. In addition, regarding the ownership structure in Family Businesses, by analyzing the number of family members in the board, their role and the portion held by independent directors, they illustrated that in family firms there is a higher connection between ownership and board structure; the board is larger if there is a higher proportion of family members in the board; it is more common to have a family Chairman rather than in other kinds of firms; there is a higher presence of independent members (and less non-family executives). Finally, they highlighted that the percentage of family firms has now increased (while foreign-owned and state-owned firms have decreased). With regard to the performance index, Tobin's Q is related both to ownership structure and pyramiding, but not to board structure.

Francis *et al.* (2012) analyzed how corporate governance affects performance from a different point of view, the crisis period. They consider the relationship between those two variables, taking into account financial data starting from the end of 2006. Their results highlight several issues: the number of independent members on the board is not significantly related to firm performance. Nevertheless, when taking into account a re-definition of "independent directors as outside directors who are less connected with current CEOs, a measure called "true independence" (p. 1) there is a positive and significant correlation with company performance indicators. Finally, they demonstrated that the frequency of board meetings, the average age of directors together with their attendance behaviors are all variables that have an impact on firm performance during the crisis period.

Fauzi and Locke (2012) analyzed a sample of 79 companies listed on the New Zealand Stock Exchange, belonging to six different industries, to investigate the effect that ownership and board structure have on the firm's performance. The data came from the annual reports of the companies from 2007 to 2011 and they were analyzed in terms of explanatory variables (number of directors and non-executives on the board, managerial ownership, blockholder ownership, audit, nomination and remuneration committees); dependent variables (Tobin's Q and ROA) and control variables (leverage, firm size and industry level).

The results were the following: the variables that have a significant positive relationship on the firm's performance are: board size, female presence on the board, managerial ownership, leverage and firm size. The same positive results also apply to the companies that follow the NZSC (New Zealand Security Commission, 2004), a set of guidelines on best practice of corporate governance. On the other hand, the survey showed a negative relationship between the presence of non-executive directors, female directors on the board and stockholder ownership with the companies' performance. Finally, the results didn't confirm the endogeneity between corporate governance and firm performance.

2.3 Ownership structure, board structure, Intellectual Capital and firm performance

The relationship between intellectual capital and ownership structure, except for in emerging countries, has been, to the authors' knowledge, little investigated. Among the studies that investigate the relationship between intellectual capital and ownership structures are Firer and Williams (2003), Saleh *et al.* (2009), Tsai *et al.* (2013), Kalyta (2013), and more recently Bohdanowicz and Urbanek (2013).

For example, Firer and Williams (2003) investigated the relationship between ownership structure and intellectual capital disclosure (ICD) on a sample of 390 listed companies in Singapore in the year 2000. Their results show a negative and statistically significant relationship between ICD and ownership concentration, a positive and significant relationship between ICD and size and a positive but non-significant relationship with leverage.

Saleh *et al.* (2009) investigated 264 listed companies in Malaysia during the period 2005-2007 in order to determine whether there is a relationship between the VAIC, the different forms of ownership structures and profitability. They found a negative but non-

statistically significant relationship between the VAIC and leverage and between the components of VAIC and leverage, while the relationship is positive and statistically significant between the VAIC and profitability as measured both by ROA and by the Market to book value. Lastly, they found a negative and almost always statistically significant relationship between the VAIC, its components and family ownership. They concluded that the negative relationship would increase the likelihood of the opportunistic behavior of family members to the detriment of minority shareholders.

Tsai *et al.* (2013) examined a sample of firms listed on the Taiwan stock market during the period 2004-2008 using performance measures such as Tobin's Q and equity returns on a quarterly basis. As a measure of intellectual capital they used the ratio of spending on human resources and sales, and as an ownership index they used the ratio of shares held by board directors and the total equity. However, their study did not show any significant relationship either between the performance and cost of human resources or between the performance and ownership share of the board directors. Instead they found a negative and statistically significant relationship between the debt ratio and Tobin's Q. By dividing instead the ownership structure between family firms and manager controlling, they found a negative and statistically significant relationship between Tobin's Q and spending on human resources in both cases and a positive and significant relationship between equity returns and spending on human resources. They concluded that Tobin's Q is an important performance indicator to measure intellectual capital and the high degree of leverage worsens the performance.

Bohdanowicz and Urbanek (2013) investigated a sample of 354 Polish companies listed during the period 2006-2011 for a total of 1,505 firm-year observations. They used a linear regression model to study the relationship between the VAIC, its components and the various ownership structures. As control variables they used the debt ratio, firm size, growth opportunities and free float. The results show a negative and significant relationship between the VAIC and manager ownership and an almost always positive and statistically significant relationship between size and VAIC and its components (VAHC and STVA). In addition, there is a negative and statistically significant relationship between the VAIC, its components and floating funds; instead they found a positive and statistically significant relationship between the VAIC, its components and the growth opportunities measured by the M/BV. Finally they divided the sample into two sub-samples made up of high-tech and non high-tech, but the results seem to follow the

same trend. The authors concluded that the results are inconsistent with other studies on the relationship between managerial ownership and performance and also in contrast with the assumptions postulated in the agency theory.

Celenza and Rossi (2013) examined both the relationship between the VAIC and ownership concentration and the relationship between the ROA (or Tobin's Q) and ownership concentration. However, they didn't find statistically significant results in the relationship between VAIC and ownership concentration measured by the majority shareholder. On the contrary, they found a positive and statistically significant relationship between the ROA, VAIC, ownership concentration and debt ratio.

Kalyta (2013) instead used a more original approach to examine whether there is a relationship between the board in which there is a higher presence of human capital with greater skills, a higher level of collective knowledge, and the value of the firm. In particular he focused on two alternative measures based on human capital and the level of education in the board, on a sample of 1,000 U.S.-listed companies for the period 2007-2010 in order to determine whether there is a relationship between Tobin's Q and the board's skills. In the regression analysis he considered the following as control variables: size, ROA, leverage, the ratio of R&D and total assets, the ratio of advertising expenses and total assets, and the market share of the 4 largest firms in the reference sector. Except for the size variable which is negative and statistically significant, for all the other variables (ROA, leverage, R&D and market share of the 4 largest firms) he found positive and statistically significant values.

He continued with a second analysis based on the study of the events and measured the market reaction to the announcement of the appointment of the board within 10 days of the announcement date. The results obtained show that the stock market reacts positively to the announcement of the board in the knowledge-intensive sector. The Cumulative Abnormal Return (CAR) ranges from 1.24 % to 1.04% within three days of the announcement date. The author concludes that the contribution made by human capital to the board for the purpose of value creation depends on the board's importance in achieving strategic objectives and therefore the knowledge-intensive firms require a qualified board with additional skills compared to traditional boards.

Most of the research on Intellectual Capital is meant to demonstrate either the correlation between the quantity and quality of information disclosed and firms'

performance or the correlation between Intellectual Capital variables and companies' performance.

Cerbioni and Parbonetti (2007) investigated how corporate governance can affect the quantity and quality of voluntary disclosure on Intellectual Capital. Since it focused on Intellectual Capital, the survey was conducted exclusively on a sample of biotechnological firms listed on the stock market of one of the European countries. After analyzing the data from the beginning of 2002 to the end of 2004, they found that board structure, leadership and size are negatively related to the amount of disclosure on IC; whilst the number of independent directors is positively related to the amount of voluntary information disclosed on IC by the companies.

With regard to the quality of the information disclosed, the empirical research showed that CEO duality has a negative influence on the disclosure of forward-looking information. Moreover, the board structure enhances the annual report's readability. Finally, the quantity of voluntary disclosure is related to a reduction of the agency costs.

Williams (2000) proposed a survey on the connection between the board's composition and Intellectual Capital performance, based on a sample of 84 listed companies in South Africa, one of the main emerging economies. He found that there is a significant positive link between both gender and race diversity across the board of directors and IC performance. The results also demonstrated a significant negative connection between the duality of CEO/Chairman and IC. Some other variables taken into account have not shown a significant correlation with IC, such as the ratio of insiders/outside and the percentage of shares owned by directors. Finally, the author suggests that "stakeholder-agency may offer itself as an applicable theoretical framework to explain the association between intellectual capital performance and corporate governance" (p. 2).

Al-Musalli and Ku Ismail (2012) investigated on how the Board's structure was affecting Intellectual Capital performance. They based their research on a sample of 147 Malaysian companies belonging to a knowledge intensive industry, the banking industry. The sample was analyzed for the period 2008-2010 with special regard on how the board's educational level, nationality diversity and number of independent directors affected IC. The results showed that the number of independent directors didn't have a positive relationship with IC performance; while the other variables considered weren't associated with IC performance.

3 Data and survey methodology

3.1 Sample

The objective of this work is to study the relationship between the performance of a sample of Italian-listed companies during the period 2002-2012 and the characteristics of both ownership structure and the board of directors.

In this regard, 40 companies listed on the stock market were examined whose capitalization was greater than 50 percent of the total capitalization of the stock market.

The analysis was divided into two stages. In the first stage, the relationship between the VAIC, the ownership structure of the three largest shareholders, and the structure of the board of directors was examined. In the second stage, the analysis was aimed at verifying the existence of a significant relationship between company performance, measured by Tobin's Q and by Return on Asset (ROA), and the characteristics of the board and of ownership structure.

The companies belonging to the sample had to meet the following requirements:

- a) the presence of firms with a high intellectual capital content;
- b) the availability of data during the entire observation period, which were acquired through *Bloomberg*, *Datastream*, the *Calepino dell'azionista* (Mediobanca), the reports on Corporate Governance and the financial statements of the individual companies.

The relationships were tested using the following equations:

$$\text{PERF} = \alpha_0 + \alpha_1 \text{BOARDSIZE} + \alpha_2 \text{BOARD_COMP} + \alpha_3 \text{OWNERSHIP} + \alpha_4 \text{BOARD_OWN} + \alpha_5 \text{CONTROL_VARIABLES} \quad (1)$$

$$\text{PERF} = \alpha_0 + \alpha_1 \text{BOARDSTRUTURE} + \alpha_2 \text{BOARD_COMP} + \alpha_3 \text{BOARD_OWN} + \alpha_4 \text{OWNERSHIP} + \alpha_5 \text{CONTROL_VARIABLES} \quad (2)$$

Where:

PERF = performance (VAIC or Tobin's Q or ROA);

Board Size = total number of members of the Board of Directors;

Board Structure = % of executives; % of non-executives; % of independents; % of women;

Board compensation = the total amount of the board's remuneration;

Ownership = the main shareholder's share, the second largest shareholder's share and the third largest shareholder's share.

Control variables = size, debt ratio, firm age, industry.

Instead, the VAIC was added as an independent variable in the models in which the ROA and Tobin's Q are dependent variables.

The following hypotheses were formulated in this study:

H1. There is a positive relationship between the VAIC and ownership structure.

H1a. There is a negative relationship between board size and VAIC.

H1b. There is a positive relationship between VAIC and board compensation.

H1c. There is a positive relationship between independent members of the board and VAIC.

H2. There is a positive relationship between performance (ROA or Tobin's Q), ownership structure, the characteristics of the board and the VAIC.

H2a. There is a negative relationship between board size and performance (ROA or Tobin's Q).

H2b. There is a positive relationship between performance (ROA or Tobin's Q) and board compensation.

H2c. There is a positive relationship between independent members of the board and performance (ROA or Tobin's Q).

H2d. There is a positive relationship between ROA (or Tobin's Q) and the VAIC.

3.2 Variable measurement

Table 1 illustrates the variables used in the study, their measurement and their relevant source of acquisition.

Table 1 - Definition for the Selected Variables

Variables	Definition	Source
Tobin's Q	[(Book Value of Total Assets – Book Value of Shareholder's Equity + Market Value of Shareholder's Equity) / Book Value Total Assets]	Bloomberg and hand collection from <i>Calepino dell'azionista</i>
Return On Assets (ROA)	Operating Profit/Total Assets	Bloomberg and Datastream
VAIC	Value Added Intellectual Coefficient = VAHC + VACA + STVA	Hand collection from firms' statements
VAHC	Value Added Human Capital =	Hand collection from firms'

	Value added/cost of employees	statements
STVA	Value Added Structural Capital = Operative Income/Value Added	Hand collection from firms' statements
VACA	Value Added Capital Assets = Value Added/physical assets + financial assets	Hand collection from firms' statements
Debt Ratio	Total Debt/Total Assets	Bloomberg, Datastream and hand collection from <i>Calepino dell'azionista</i>
Log Size	Log of Total Assets	Bloomberg, Datastream and hand collection from <i>Calepino dell'azionista</i>
Largest_Bh	Largest Blockholder	Hand collection from CONSOB and Corporate Governance Reports

Table 2 illustrates the descriptive statistics of the individual variables used. The dependent variable, according to the models used, is the VAIC, the ROA and Tobin's Q.

For Tobin's Q the mean (1.22) and median (1.14) are very similar. This indicator is widely used in the literature since it is considered capable of measuring intangible assets (Morck et al., 1988).

The mean and median also seem very similar for board compensation, executive members, non-executive members and women on board. It should be noted that this latter indicator is practically almost always absent in the first observation period.

Table 2 - Descriptive Statistics for the Selected Variables

	Obs.	Average	Median	Std. Dev.	Min.	Max.
Tobin's Q	400	1.22	1.14	0.38	0.57	2.48
VAIC	400	3.34	2.60	2.79	-0.01	16.82
Board_Comp	400	2.59	2.81	0.93	0.00	3.96
Largest_Bh	400	42.53	43.87	19.59	0.00	86.09

ROA	400	3.13	2.66	3.77	-2.58	13.26

However, in order to examine all variables in a more complete manner, the analysis has been divided into four sub-periods (2002, 2005, 2008 e 2011). Moreover, in order to avoid endogeneity problems among the variables (Demsetz and Lehn, 1985), the statistical technique of dependent variable lagged was used in this study.

4 Results and discussion

Table 3 shows the results of the multiple regression analysis which considers the VAIC as a dependent variable.

Table 3. Relationship between VAIC, Ownership structure and Board structure

Note: (*), (**) and (***) indicates significance levels of 10%, 5% and 1% respectively. VIF = Variance Inflation Factor. T-value is given in brackets

There is a positive and statistically significant relationship between the VAIC and ownership structure only in the period 2008 (model 2). With regard to board structure, there are no particularly significant relationships. In particular, the relationship between board compensation and the VAIC appears to be negative and statistically significant in the period 2008 and 2011.

In the same period the relationship between the VAIC and the executive and non-executive percentage also seems to be negative and statistically significant.

The relationship between the VAIC and board size also appears to be negative and statistically significant in 2008.

With regard to the relationship between the VAIC and ownership structure, the variable is positive but never statistically significant. Size, instead, appears to be related positively with respect to the VAIC both during the sub-periods and during the entire period examined.

Hypothesis H1 must therefore be rejected, except for the period 2008 (model 2). Sub-hypotheses H1b and H1c must also be rejected. On the contrary, hypothesis H1a can be accepted in particular with reference to the period 2008.

Table 4 illustrates the results of the relationship between Tobin's Q and the independent variables.

The relationship almost never appears statistically significant between Tobin's Q and ownership structure, except for in 2011 in model 2 in which the relationship is positive and statistically significant with the third largest shareholder.

Table 4. Relationship between Tobin's Q, Ownership structure, Board structure and VAIC

The results of the relationship between Tobin's Q and women on board appear to be equally discordant. The relationship is positive and statistically significant in 2002 and negative in 2011. In all the other cases it isn't significant. On the other hand, the relationship regarding the non-executives is interesting, whose data are positive in 3 cases out of 5 and with reference to 2011 they are also statistically significant.

Therefore, all the hypotheses formulated for Tobin's Q must be rejected.

Table 5 reports the results of the relationship between the ROA and the independent variables.

Table 5. Relationship between ROA, Ownership structure, Board structure and VAIC

From the Table 5, it can be inferred that the relationship between the ROA and ownership structure is always positive and statistically significant in 2005 and 2011 in both models.

Therefore hypothesis H2 can be accepted.

The relationship between the ROA and the VAIC is always positive but statistically significant only in 2011 (model 2). In this regard, hypothesis H2d cannot be rejected.

The relationship between board size and the ROA is always negative but never statistically significant. In this case also, hypothesis H2a cannot be rejected.

The relationship between board compensation and the ROA is almost always negative and statistically significant in 2011 (model 2). Therefore, H2b must be rejected.

Instead, with regard to the relationship between independents and ROA, the sign of the coefficients alternates and they are never statistically significant.

Sub-hypothesis H2c cannot be accepted.

With regard to the relationship between the ROA and women on board, the coefficients alternate signs and are almost always statistically significant. However, in the case of positive signs they seem to enhance performance compared to the negative sign.

A separate discussion must be reserved for the non-executives since they are statistically significant in 3 cases out of 5, even if they assume alternate signs. The debt ratio is always negative and almost always statistically significant.

The values assumed by the debt ratio appear to be in contrast with the work of Celenza and Rossi (2013b) in which they were positive and statistically significant.

5 Conclusions

The objective of this paper is to examine the relationship between the efficiency of intellectual capital, measured by the VAIC, ownership structure and board structure on the one hand, and on the other hand to verify the existence of a relationship between the ROA and Tobin's Q with regard to ownership structure and the characteristics of the board.

For this purpose, a sample of companies listed on the Italian stock exchange during the period 2002-2012 was examined. Subsequently, the analysis was conducted on 4 sub-periods.

In general, the results obtained do not confirm the hypotheses. In particular, the VAIC doesn't seem to be affected at all by the ownership structure, let alone board structure. The same conclusions are reached by examining Tobin's Q.

With regard to the ROA, instead, the relationship regarding ownership structure can be accepted and the results of this work seem to be consistent with those of Celenza and Rossi (2013b).

With reference to the characteristics of the board, the results obtained are discordant since there seems to be a negative sign relationship between the ROA and board size, as expected.

The presence of a non-monotonic relationship in all the performance models examined should be noted, which is in line with the affirmations of Morck *et al.* (1988). As regards the relationship between performance and board size, the results obtained appear to be in line with those of Yermack (1996) who finds a strong and negative relationship with Tobin's Q. In addition, if confirmed, they are also consistent with the assumptions made by Jensen (1986), who sustains that a board which is too widespread is less efficient in its role of monitoring opportunistic behaviour by management.

Lastly, the results of this study also appear to be in contrast with other works which study the relationship between performance and women on board. In particular, the data are not always positive and statistically significant, as Campbell and Minguez-Vera (2007) and Adams and Ferreira (2009) sustain. The data obtained are similar to those by Fauzi and Locke (2012) both with regard to the coefficient women on board and the size factor.

Structured Abstract

Purpose – We want to analyse how knowledge can favour growth through open and social innovation models (Chesbrough, 2003, Komninos et al., 2011). In particular we focus on smart cities, realized to identify “innovative solutions to city management” (Toppeta, 2010), in order to underline how they can support sustainability (Tanguay et al., 2010). We start examining the smart growth, focusing on the inputs induced by smart cities policies. Then we analyse the firms, searching for the motivations (Ardichvili et al., 2003) of their establishment in smart territories and finally we underline the role of knowledge sharing between firms and local actors.

Methodology – We conduct a case studies analysis (Yin, 2003) aiming to compare different urban contexts and define the issues emerging from literature review in line with our purpose. Case studies approach is suitable when studying knowledge in contexts definable as similar (Davenport, 1997). Moreover we have chosen to investigate three smart projects classified on the basis of their dimension as city (Malta), corridor (Manchester), and district (Barcelona). Furthermore we have selected the empirical evidences taking into account the project leader, as we have a joint venture (Malta), a pool of local agencies (Manchester), and an in-house company public owned (Barcelona).

Originality/value – This research sheds some new light on the role of knowledge in smart cities as knowledge is not commonly considered as an autonomous and relevant feature. This lack of consideration is confirmed when analysing smart cities’ models and platforms (Bifulco et al., 2014), but just as embedded in (and carried by) actors (Lombardi et al., 2011), hence it is often hidden behind other aspects. In our research we underline its relevance in smart projects and we describe as it can be considered as a priority to set up a fertile ground for *smartization* and sustainability through social innovation.

Practical implications – Our results enhance the approach to knowledge when proposing social innovation initiatives: the project leaders involved in smart projects can read

*This work has been supported by the project OR.C.H.E.S.T.R.A. (ORganizational of Cultural HEritage for Smart Tourism and Real-time Accessibility) in the Italian National Operative Program 2007-2013.

through different lens the prevailing models to leverage on knowledge (Dhanaraj and Parkhe, 2006) in order to reach sustainability aims. This knowledge-centred approach can favour the mixing and circulation of several sources of knowledge (Anttiroiko et al., 2013). Moreover the creation of new knowledge can favour participation from the different urban actors (Paskaleva-Shapira and Barroca, 2012). Finally the focus on sustainability through knowledge management can be a stimulus to the location of firms in a specific territory (Porter, 2000).

Keywords – knowledge management, sustainability, smart cities, social innovation, open innovation.

Paper type – Academic Research Paper

1 Introduction

The increasing role of urban contexts in the knowledge economy has brought to the diffusion of *smartization* processes, namely different initiatives towards the reaching of a smart, sustainable, and inclusive growth (EC, 2010).

The different actors involved in these projects, especially public administrations and industry players, have a specific role in the collaborative environment of the smart ecosystem, in order to reach sustainability (Tanguay et al., 2010). This aim is related to the development of the so called *drivers*, namely various groups of activities that collect and guide the planning of interventions, that are usually gathered in operative models by technology vendors or consulting companies.

The activities undertaken for the elaboration of smart projects are strictly related to the generation, circulation, and use of knowledge (Yigitcanlar et al., 2008) among the different actors within the ecosystem, namely public institutions, universities, research centres, people (workers and citizens), and firms.

The wide range of players in these urban contexts has induced an extension of the traditional models of analysis, from the triple helix to a quintuple helix model (Leydesdorff and Etzkowitz, 1998; Arnkil et al., 2010; Lombardi et al., 2011; Carayannis et al., 2012), and has conducted us to the analysis of three case studies with a focus on the exchange of knowledge among the different stakeholders of the ecosystem and the new technological, human and organizational capabilities, in order to understand the location of firms in smart contexts.

2 Literature review

2.1 Sustainable development and smart growth

The relevant challenges to be faced in modern times have induced both the policy makers and the economic actors to possible resolutions, based on collaborative strategies and a wide sense of co-responsibility. These features have brought to a focus on the well-known concept of sustainability and its close relationship with the development issue, especially referring to three dimensions of economic, environmental and social sustainability.

A central role has been played by the international and supranational institutions, starting from the setting of the common base by the United Nations, within the World Commission on Environment and Development, to the important activities undertaken by the European Union and its Europe 2020 strategy.

In Europe the environmental issue and its famous “20-20-20” targets (improve energy efficiency, reduce greenhouse gas emission, and energy consumption), preceded the wide objectives of the Europe 2020 strategy, which aims to deliver growth through the development of initiatives related to “three mutually reinforcing priorities” (EC, 2010):

- smart growth, improving the digital society, knowledge, research and innovation
- sustainable growth, promoting green technologies, smart grids, and efficient and sustainable use of resources
- inclusive growth, modernising labour markets and welfare systems, and promoting the employment rate among women, young people and older workers.

Innovation is one of the main flagships developed among these priorities, as an incentive to competitiveness, benefits for all actors and partnerships, and the Programme Horizon 2020 is the related financial instrument, helping the achievement of excellent science, industrial leadership and tackling societal challenges (EC, 2011).

These strategies can be implemented at different territorial levels and the smallest one is the urban context, nowadays facing a growing rate of population and a higher expectation of a better life that makes people moving into cities (Shen et al., 2011) and pressing local government and all stakeholders to get engaged. The different actors involved in these areas are facing the emerging problems through the development of projects, namely smart cities which look at innovation and combine hardware and

software infrastructures (ABB, 2012) in order to develop more “efficient, sustainable, liveable” cities (Toppeta, 2010).

The setting up of smart projects is linked to the concept of sustainable development, which can assume other features in addition to the three main economic, social, and environmental aspects. In detail the sustainability in urban contexts requires the integration of the qualities associated with interactions and the overlapping of these dimensions (Tanguay et al., 2010): development must also be equitable, liveable, and viable.

The achievement of sustainable aims can be stated only with the analysis and evaluation of the undertaken initiatives through the creation and adoption of suitable indicators. The international debate among the different tools for monitoring sustainability has recently converged towards the adoption of the so-called “Dashboard of sustainability”, developed by the Consultative Group on Sustainable Development Indices (CGSDI) and the Joint Research Center (JRC). It supports a synthetic representation of the above mentioned dimensions for the comparison among the performance of sustainability of different countries, but can also be applied in a local urban context (Scipioni et al., 2009).

The sustainability in smart cities projects are related to *drivers*, namely the elements that collect and guide the planning and the development of the activities in a specific context of intervention (energy and environment, transport, services to citizens, ICTs, participation and economic growth). In detail the *smartization* process starts with the choice of one or more *drivers* and within them different indicators can be applied to monitor and measure the sustainability of the activities realized.

This central role of sustainability in the development of smart cities is underlined within the documents elaborate by the industry players and the local public entities involved in the projects. Among the different private-sector partners of cities, many technology vendors have pursued the opportunities to map their products and services to the goals and initiatives of smart cities (Bélissent, 2010), developing operative models with the integration of different *drivers* and looking for a sustainable approach to smart cities management.

Many industry players have developed documents on smart cities with the presentation of their solutions for smart cities, illustrating their operative models and the mix of the different *drivers* (Bifulco et al., 2014). Most of them analysed the concept of

sustainability especially from an environmental, and consequently economic, point of view, looking at the reduction of the cost of services with a more efficient management of energy, water, waste and transport *drivers*.

A wider point of view can be found in Accenture's vision on smart cities (2011), that after the explanation of its own model, analyses the linkages among the sustainability and the different *drivers*, stating the priority of a reduction of the environmental impact with smart initiatives on energy, waste and water management, and transport, and it underlines the importance of citizens education and engagement in sustainability goals.

The relationship between the actors involved in smart projects and the concept of sustainability in smart cities can be also identified in the elaboration of Siemens (2011), aiming for the integration of different stakeholders interests in order to achieve a higher degree of cohesiveness, and Microsoft (2013), looking for people empowerment in government, businesses, and the community through innovation.

The above mentioned perspectives of analysis can be also observed from the public administrations' points of view, which allow a focus on the concept of sustainability both in the development phase and during the monitoring.

2.2 Towards creative and knowledge cities

The increasing number of smart projects is a consequence of the central role of urban areas in the knowledge economy (van Winden and van den Berg, 2004), as the "greater reliance on intellectual capabilities" (Powell and Snellman, 2004) has its main evidences in cities, where knowledge is produced, processed, exchanged and marketed by institutions (universities, research centres, etc.), people (workers and citizens), and ICTs infrastructures.

The requirement for the generation, circulation, and use of knowledge within urban economies (Yigitcanlar et al., 2008) is not the only factor to be analysed in the development of cities, because the aim to a higher quality of life is influenced by a variety of issues that can be identified as smart projects *drivers*.

The *smartization* process in urban areas requires new infrastructures, or the improvement of existing ones, in order to provide multimodal accessibility and facilitate the exchange of goods and people (*driver* transport), but also to enhance the transfer of information through software and hardware components (broadband networks, sensors, wireless connectivity, etc. – *driver* ICTs).

The relationship between knowledge and the development of the other *drivers* (energy and environment, services to citizens, participation, economic growth) in smart projects can be analysed by a comparison with the four axes of the framework of knowledge-based urban development (KBUD) proposed by Yigitcanlar and Lönnqvist (2012):

- Enviro-urban development can be related to the *driver* energy and environment that aims to conserve natural resources, improve urban open spaces and buildings, and enhance the air quality.
- Socio-cultural development refers to one of the services that cities have to assure to their citizens, enhancing residences' skills and knowledge and addressing their needs and desires.
- Institutional development is the focus on the extension of democracy and collaborative participation among the different urban stakeholders, especially citizens.
- Economic development corresponds to the creation of a good business climate and the achievement of prosperity.

All these activities are undertaken by different actors participating in the *smartization* process within cities through a “collaborative leadership” (Foray et al., 2012), as a collective endeavour for efficient innovation systems, based on public-private partnership.

The participative design of smart projects has extended the triple helix model (Leydesdorff and Etzkowitz, 1998), based on the relations among university, industry, and government, with the inclusion of other actors. The additional element has been identified in users within the quadruple helix model (Arnkil et al., 2010), that analyses the urban context from the point of view of new user-oriented innovation strategies and it considers the fourth helix as a wide group bundling citizens, employees, residents, civil society associations, and different kind of users (ordinary, amateur, professional, lead, non-user).

A further evolution of this model has been developed through the so-called advanced triple helix model, focusing on smart cities performance (Lombardi et al., 2011) which adds three themes: the knowledge stock generated by the interplay between universities and industry, the collective learning mechanism taking place when universities help government in the development of public management solutions, and the market institutions which benefit from the innovation processes fostered by industry and government.

The last review of the helices model has conducted to the quintuple helix (Carayannis et al., 2012), composed by five different systems packing actors and resources, namely the education system, economic system, natural system, media-based and culture-based public, and political system.

One of the main challenges for smart cities is the combination of all the above delineated actors through the formation and management of partnership and alliances that may have to create a sustainable ecosystem (Lee et al., 2013). The exchange of knowledge among the different stakeholders of the ecosystem and the new technological, human and organizational capabilities, allow the location of firms in the urban context to offer new services, and maybe to foster emerging industries.

The creation, evaluation, and exchange of knowledge, can be used to produce economic benefits especially in terms of high-technology businesses and services, education, and research and development (Yigitcanlar, 2011). As stated by Laszlo and Laszlo (2002), aiming at the economic development, it is central to codify technical knowledge for the innovation of products and services, market knowledge for understanding changes in consumer choices, financial knowledge to measure the inputs and outputs of production and development processes, and human knowledge in the form of skills and creativity (Lever, 2002).

These different features of knowledge represent the result of the evolution of the first studies on knowledge assets which emphasized the firm's codified knowledge resulting from its internal research and development capacities, while nowadays it is accepted the major role of external sources of knowledge in the firms' capability to innovate (Vaz and Nijkamp, 2009). Then the creation and circulation of knowledge in urban ecosystems allow the creation of innovation among businesses in different ways (James et al., 2011): the existing enterprises can move into new business industries, while new entrepreneurial firms may emerge from both horizontal linkages (between firms) and vertical linkages (alliances between entities that operate at different levels in smart city).

The important role of knowledge in urban contexts is related to the theoretical evolution of smart cities concept, as cities with a high quality of life, thanks to the combination of so-called hardware and software components (ABB, 2012).

The essential idea of quality of life has been developed in connection with the concept of creative city (Florida, 2003), aiming to the improvement of knowledge economy through the so called 3Ts: technology, defined as a function of innovation and high

technology concentrations; talent, related to high educated people; and tolerance, linked to openness, inclusiveness and diversity to all ethnicities.

The consideration of knowledge as a stimulus to urban quality of life, as it emerged from creative cities, is similar to the implications that arise from the concept of knowledge city. It refers to an urban context involved in the attraction of talent and innovation for the creation of high value-added products using research, technology, and brainpower (Yigitcanlar et al., 2008).

The theorization of the buzz concept of being clever, creative or smart has been developed among different literati and summing up all the contributions, there are two main positions: the first one, elaborated by Lee et al. (2013), assimilate the concept of knowledge city to the idea of intelligent city, focused on the achievement of innovation and the nurturing of knowledge, and it considers both as components of a previous step towards the inclusive concept of smart city. However the other position has been taken on by Marsal-Llacuna et al. (2014) which separate the notion of intelligent city from the knowledge city, which is considered as a “bridging initiative” to the intelligent cities, or better known smart cities.

The analysis of the theoretical positions and the examination of different *smartization* processes taking place in many urban contexts have conduct to the awareness of the equivalence between the concepts of knowledge city and intelligent city, as they are both related to the central role of human and social capital in the knowledge economy (Lee et al., 2013). On the other hand, the idea of smart city has been developed in order to include a wide group of activities and actors involved in urban areas, looking at the increasing number of initiatives to be started for each *drivers* (energy and environment, transport, services to citizens, ICTs, participation and economic growth), so that this concept can be considered as a box where all the previous definitions are contained and integrated in a new wider idea.

3 Purpose and methodology

3.1 Purpose

The emergence of issues on smart cities projects and the wide interest they have risen from various big companies, have inducted us to analyse the attractive force exerted between these projects and business. We want to delineate the motivations that push firms

of different sectors in investing and localising their activities in such urban contexts involved in *smartization* processes. In particular, we want to identify the importance of knowledge as a feature in smart projects, even so its propelling role. So our first research question is:

RQ 1: Which is the role of knowledge in the development of smart projects? And how can we define it?

This first step of analysis has showed us a wide perspective that allows us to go deeper in our study, searching for the motivations that conduct firms to locate their activities in such urban contexts through our second research question:

RQ 2: Why are firms attracted to smart cities? And which are their implicit goals for the location of their activities in these urban contexts?

3.2 Methodology and data analysis

The methodological approach we have chosen in order to answer our research questions is qualitative, in particular we have conducted a case study analysis, because of the characteristics of our research (Yin, 2003): we have posed “how” and “why” questions, and the study is focused on a contemporary phenomenon within real-life context, such as smart cities projects.

In detail we have performed a multiple case analysis with the choice of three cases, according to the literary replication criteria (Royer and Zarlowski, 2001) when studying knowledge in contexts definable as similar (Davenport, 1997), in order to identify the knowledge management activities, the sustainability aims and both impacts and consequences for the social context. As it regards this last issue, we investigate people contributions and benefits, firms’ role and activities, and local agencies in different cases.

Our selection of the three cases has also been related to a different spatial dimension among them because “spatial dimension in analysis may yield different, and more meaningful, results, than an analysis which ignores it” (Bailey and Gatrell, 1995). So we analysed three different projects classified on the basis of their dimension as city (Malta), corridor (Manchester), and district (Barcelona). Furthermore this choice has been made by taking into account the features of the project leader involved in these projects, as we have a joint venture (Malta), a pool of local agencies (Manchester), and an in-house company public owned (Barcelona).

The empirical evidences have been investigated through the analysis of reports and official documents available on the project websites, and papers elaborated by the different stakeholders involved in the initiative.

4 Results

4.1 Malta

In 2007 in the industrial area of Ricasoli (360.000 m²), along the eastern coast of Malta's island, an ambitious project started aiming to build a smart city as a bridge among three continents, Europe, North Africa and Middle-East.

The project, called SmartCity Malta, is the result of a joint venture between Smart City (member of TECOM Investment – Dubai Holding) and the Government of Malta, which has given exclusive development rights to the company. SmartCity is a global network of self-sustained townships for knowledge-based industries, based on the model of Dubai Internet City, Dubai Media City and Dubai Knowledge Village.

The purpose of this smart city project is the transformation of “the country's economy to one powered first and foremost by knowledge” (SmartCity Malta, 2010), with the creation of an ICT and media cluster as destination for high-tech industries. This self-sustained industry township aims to offer infrastructures, environment and support systems for knowledge-based companies, and it is involved in the creation of offices, residential and retail spaces, with one-third of the land set aside as open areas.

All the completed or under construction structures are built according to the international sustainability standards, with a focus on the protection of the environment and the provision of a comfortable and healthy place for living and work.

The basic idea of SmartCity Malta is the creation of an attractive urban context, especially for knowledge-based enterprises, providing ICTs and social infrastructures, and media and production services. In details, the technological key amenities include a full digital telecommunications network with high-capacity undersea fibre-optic cables linking Malta to Europe, high-speed internet connections for all homes and businesses, communications infrastructure and consultancy services from global technology leaders (SmartCity Malta, 2011); on the other hand, the focal point on the media industry is linked to the provision of complete technical infrastructures for movies, television, music

production and tied fields, including comprehensive production and post-production facilities and support services.

The promotion of business opportunities is linked to a wide range of consultants, specialists and services that stimulate firms' investment in the area, helping the enterprises in the strategic choices and during their starting activities on the island.

At the end of 2010, the first development phase was concluded with the opening of the first building (SCM 01), made up of 12.000 m² of smart office spaces, specifically planned at achieving best results in terms of efficiency, sustainability and life cycle analysis: these works have included the construction of the service culvert and the installation of below ground services, as the backbone for the supply of power, telecommunication, irrigation water, drinkable water and other services. Among the firms setting up in Malta, two main companies, namely Cisco and Hewlett-Packard, have decided to establish their offices in SCM 01. Meanwhile the second phase of the project started from 2011 and will offer a comprehensive range of additional spaces, with the construction of other four buildings, in particular two blocks will create new space to be used for offices while some other will be reserved as exclusive retail space.

4.2 Manchester

The city of Manchester began its journey towards a wide concept of urban regeneration since the late 1980s, after a long period of industrial activities which left extensive brownfield areas and a high level of unemployment. The solution adopted to overcome these problems was a shift towards a service-oriented economy with a focus on culture, innovation, ICTs, and digital technologies as transversal features to sustain economic growth.

This phase was strictly related to a common phenomenon in UK, namely the urban cultural strategies, and was strengthened by the latest progress in the knowledge-intensive economy which is linked to an increasing attention on the so-called digital economy (Manchester Partnership, 2012). In fact in 2003 the Manchester Digital Development Agency (MDDA) was founded with the aim to develop and implement the city digital strategy, related to the enhancement of digital inclusion, industries and innovation.

The City Council, thanks to the involvement in different partnerships, from the Manchester Partnership to the Manchester City South Partnership, has developed different projects, labelled as smart for their linkages with ICTs, high quality of life and economic

growth (Manchester City South Partnership, 2009; Manchester Partnership, 2012): SHARP project, MediaCity UK, Apprenticeship and Skills Hub, Low Carbon Hub, Airport City Enterprise Zone, Civic Quarter Regeneration Framework, Manchester Living Lab, and the Corridor.

The last mentioned project, the Oxford Road Corridor Manchester, commonly known as Corridor Manchester, was created in March 2008 (Corridor Manchester, 2009), through a partnership among Manchester City Council (MCC), The University of Manchester, Manchester Metropolitan University (MMU) and the Central Manchester University Hospital NHS Foundation Trust. The partnership, situated in a 2,43 km² area along the central Oxford Road, has been created with the purpose of generating further economic growth and investment in the urban knowledge economy.

The Corridor is an area full of knowledge-intensive organizations and businesses, operating in different areas, namely health, education, creative industries, financial services, and ICTs. The vision of the partnership is to create an original, creative, and smart place, “where knowledge goes to work” (Manchester City Council, 2013) and the strategy to realise it is based on five themes: sense of place, transport, environment and infrastructure, research and innovation, and employment, business and skills.

The Corridor initiatives to support innovation are the results of the activities undertaken by different business incubators for start ups, new enterprises, and the development of new product and services, that are the Manchester Science Parks (msp), the MedTech Centre for medical technologies, and two universities entities, the University of Manchester Innovation Group (UMI3 – inspire, invent, innovate) and Innospace (MMU’s business incubator).

In particular the main projects focused on firms are the “Corridor Connections” and “myKnowledgeExchange”. The first brings together companies, researchers and innovators to develop cross-sector collaborations, enhance innovation in priority areas (e.g. low carbon economy, medical devices and future cities), and rise the Corridor profile as an innovation hub and a test bed for new technologies, product and services (Corridor Manchester, 2013). The other project, “myKnowledgeExchange”, or myKE for short, strengthens the facilities for a collaborative environment through a social networking website that provides online access to world-leading expertise, facilities and resources on Corridor Manchester (www.myke.biz).

4.3 Barcelona

The city of Barcelona started its urban regeneration in 2000, after the constitution of the in-house company public owned, namely 22 ARROBA BCN, S.A. (22@Barcelona). The purpose of this company is to develop and execute all types of urban-planning projects in the old industrial and productive areas of Poblenou, concerning the whole South-Eastern quadrant of the city (2,83 km²), with urban designation of 22@ or related to it, in order to substitute the traditional designation “22a” for industrial soil contexts.

The starting activities concerned the construction of new buildings, the deployment of public spaces and green areas, and the equipment of new technologies infrastructures, so that 22@Barcelona could start the path of the knowledge economy, in order to become an important hub of science, technology and culture, where the most innovative companies co-exist with research, training and tech transfer centre, as well as housing, facilities and green spaces.

The urban regeneration phase ended in 2004, when policies were put in place to promote economic activities, with a focus on the development of emerging sectors and the creation of five urban clusters within the district: media, ICTs, medical technology, energy, and design (added in 2008), with the corresponding main centres Barcelona Media Innovation Centre, Barcelona Digital Foundation, MedTech Technology Center, Catalan Energy Research Institute (IREC), and Barcelona Centre of Design (BCD).

These developments have allowed to recognize Barcelona as a smart city pioneer, leading innovation, sustainable and economic growth in order to create a “model knowledge space” (Barcelona City Council, 2010) that promotes collaboration and synergies among university, public administration and firms, and fosters the enhancement of a culture of talent and knowledge.

The presence of facilities and the collaborative environment have attracted different firms, especially the knowledge and technology intensive companies, that have decided to establish their activities in the 22@Barcelona. In fact the pace of economic regeneration, despite the economic panorama, has been positive: between 2000 and 2003, 489 companies moved into the district; from 2004 to 2006 there were 552 new incoming firms, and from 2007 to 2009, 461 new companies moved in (Barcelona City Council, 2010).

These positive results have been reached also thanks to the development of the initiative 22@PLUS business services, started in 2008, that supports the firms in the

studies of their possibility of moving into the district (Barcelona City Council, 2009), with the creation of a catalogue of services and value-added elements offered by the 22@Barcelona, namely technologies and knowledge infrastructures, business cooperation networks, cluster strategies, access to public and private funding, facilities and innovative spaces, access to talent, take-off platforms, and access to market.

Furthermore, in the same year, the innovation district launched the 22@Urban Lab, a project created with the aim to encourage business innovation and facilitate the use of public space as an urban laboratory to test new products and services, especially those that will help to improve people's quality of life and related to the different areas of urban development, mobility, ecology and ICTs (Barcelona City Council, 2013).

5 Discussion

The analysis of all three cases allows us to answer to our RQ1, stating the important role of knowledge in smart projects as a prerequisite for the success of sustainable urban development (Caragliu et al., 2011), and a driver for the increase and enhancement of the participation among urban actors (Paskaleva-Shapira and Barroca, 2012).

We have recognized that knowledge can be considered the engine of both a new economic development, as it happens in SmartCity Malta, and a transformation of an old industrial economy, as it emerged from the Corridor Manchester and 22@Barcellona.

In details the presented smart initiatives can be a context for the application of the dynamic model of knowledge-creating firms (Nonaka and Toyama, 2005) in urban contexts: they have the characteristics of an ecosystem in which the different stakeholders create knowledge through dynamic interactions among them and within the environment.

In this context of innovation, the focus on knowledge is based on relations, interactions and dynamics among the actors (Anggraeni et al., 2007), that can be related to a recent transformation of some cities governments in learning organisations for the formulation and implementation of smart city policies (Anttiroiko et al., 2013): in this way the main actors in urban contexts, such as public administrations, assure the knowledge mobility, namely the sharing, acquisition, and deployment (Dhanaraj and Parkhe, 2006) of knowledge within the ecosystem.

The selected smart projects have conducted us to the identification of their basic characteristics and a deeper analysis of the above mentioned *drivers*: in literature

knowledge is not mentioned among them, but we have recognized it is a prerequisite, referring to it as “local knowledge base” (Caragliu et al., 2011).

The knowledge as a pillar in smart projects is strictly related to the important role of ICTs so that we can be considered both as *cross drivers*, namely fundamental resources for the development of urban sustainable development, without them no initiative could be referred to as smart.

As it concerns our RQ2, the ecosystem of actors in smart projects includes firms and we can affirm that they are attracted in these particular urban contexts above all by the wide circulation and creation of knowledge. In fact this resource is considered as one of the most valuable assets of an enterprise that has to be managed efficiently and effectively in order to gain a competitive advantage in the knowledge economy (Ergazakis et al., 2006).

The location in smart contexts is also related to the importance of physical interactions in a physical space (von Krogh and Geilinger, 2014) which allows the sharing of knowledge in a circular holistic approach, and where the lead users cooperation with firms to create explicit knowledge, thanks to the contribution of their ideas towards the development of new products in a co-creation perspective (Schaffers et al., 2011).

In fact the interactions among the actors in the smart project ecosystem allow firms to create new knowledge by synthesizing their own intellectual capital with the knowledge embedded in the other players (Nonaka and Toyama, 2005), such as customers, suppliers, competitors, universities, or public entities (Leydesdorff and Etzkowitz, 1998; Arnkil et al., 2010; Lombardi et al., 2011; Carayannis et al., 2012).

Within smart projects, these new resources of knowledge become part of the knowledge flow circulation which aims to drive high-tech company start-ups and existing companies’ enhancement and competitiveness, nurture and attract talented people, intensify creativity, develop human capital and research excellence, facilitate the cross-fertilisation of ideas, and encourage the creation of innovative and competitive product and services (Ergazakis et al., 2006).

6 Conclusions

Our analysis of three smart projects has confirmed the necessity of companies to operate in an environment that fosters innovation and favours the acquisition and dissemination of knowledge as well as learning, in order to survive in the contemporary

context of knowledge economy (van Winden and van den Berg, 2004; von Krogh and Geilinger, 2014).

This environment has been delineated by literati as an ecosystem which interrelates various types of actors, namely firms, public agencies, citizens, university, and research institutions (Leydesdorff and Etzkowitz, 1998; Arnkil et al., 2010; Lombardi et al., 2011; Carayannis et al., 2012). These entities can be defined as “loosely coupled” players (Freeman, 1991) because they are linked with exchange relationships (coupled), but the absence of hierarchical controls preserves independence (loosely): so the resulting image is of ecosystem as an environment composed by loosely coupled players.

The smart projects aims to reach a better quality of life and sustainable development (Tanguay et al., 2010; Foray et al., 2012) are strictly related to the integration of different *drivers* in an operative model that allows every actors taking part in urban contexts to satisfy their requests.

The development of these initiatives is frequently based on investments in ICTs and knowledge (Yigitcanlar et al., 2008; Toppeta, 2010; Marsal-Llacuna et al., 2014) as elements that joint together are able to attract companies and talent people, enhance the educational system, create a more liveable urban context, stimulate citizens’ participation, and develop the commitment of public administrations in sustainable activities (economic, social and environmental).

In connection with these goals, we have focused our attention on the relationships among the circulation of knowledge, the development of new business activities, and the attractive role played by these smart projects on companies (Vaz and Nijkamp, 2009). The knowledge-based ecosystem is strictly related to new entrepreneurial initiatives that comes out of social and human capital and has the potential to foster emerging industries (Lee et al., 2013): the existing enterprises may move into new business industries, while new entrepreneurial firms may emerge from both horizontal linkages (between firms) or vertical linkages (alliances between entities that operate at different levels in smart projects).

Our study has been conducted through the case analysis of three empirical evidences, but the results are based on reports and official documents prepared only by the pivotal player and available on the official websites of the smart projects. Further research could be based on a deeper analysis among the different stakeholders involved in the projects, especially firms, in order to compare the motivations that we have underlined with the

actual benefits attained through the location of businesses within the ecosystem. Moreover the data for this advanced study could be collected through some interviews with the main actors, both the managers of companies and the public officials who are responsible of the smart projects.

Finally it could be interesting to widen the context of investigation in order to analyse the achieved results in economic, social and environmental sustainability within the ecosystem, with a comparison of the outcomes of firms located in both smart projects and normal contexts.

Structured Abstract

The growing attention toward sustainability report pushed companies, private and public as well, to adopt instruments able to rate sustainability and environmental impact. Many tools can be used to evaluate social communication but the sustainability report is the most complete to explore, measure, understand and communicate the results under this aspect. Through the sustainability report is possible to supply a balanced vision of the sustainability performance of an organization and to understand all the positive and negative effects generated running the activity. To report the activity NPOs as well, has to disclose results and their connection with the surrounding community as social, environmental and economic impact. The voluntary disclosure of Triple Bottom Line information through proper tools, as the sustainability report, The sector vision of the environmental and social report, differently from the sustainability report, does not allow a complete disclosure on social and environmental activity carried on by the companies. Consequently is not fully represented the impact of these activities on the community. Nowadays NPOs use framework, which partially represent the sustainability activities. NPOs as well as for profit organizations have to introduce new reports keen to fill the information necessity of the stakeholders

Purpose – The research tries to build a NPOs' sustainability report able to disclose economic, environmental impact, through a set of relevant indicators

Design/methodology/approach –after a review of the existing literature, the research aims to build a sustainability report for NPOs through a set of economic, environmental and social indicators based on best international practice and in line GBS (Gruppo di studio per il Bilancio Sociale) principles and GRI (Global Reporting Initiative). Then the report will be applied to a voluntary service center (CSV) which contains, for its function and organization, in a wide range, all the environmental variables, social and economic, to be monitored in any NPOs

Originality/value – a new sustainability report for the Italian and European NPOs built on the above set of indicators shows the sustainability level reached by the two NPOs and their social impact on the surrounding community.

Practical implications -The findings appear to suggest an innovative model of sustainability report for NPOs with a significative set of indicators which offer a new disclosure of the activity carried on by the organization. Limit: the work is tested only on a limited number of NPOs which can be extended in the future. Then, as there are many entities similar to CSV around Europe, is necessary also to implement the model in other countries.

Keywords – No profit organizations, sustainability report, economic, social, environmental indicators

Paper type – Academic Research Paper

1 Introduction¹

A sustainable organization, whatever typology it has, is not only financially stable but minimizes its negative environmental impacts and act in accordance with social expectations. Everything in the knowledge to address the future generations with an attitude of greater responsibility for what has been produced in terms of not only economic but also ethical , environmental and social (Jonas , 1978).

The attention to sustainability aspects, led all organizations to determine their own sustainable development through the identification and reporting of what has been done in terms of environmental, social economic impacts.

The document through which organizations represent the impact that their actions have on the economic, social and environmental aspects is named sustainability . The creation of a report on the economic, environmental and social issues is a recurrent habit and is both due to pressure from interest groups and the benefits the company gets in terms of image and credibility. In addition, national and international governmental institutions ask, with force, companies to report their goals and the consequences of their behavior in terms of quality of life, environmental protection, respect for human beings (Paris , 2003).

While the social and environmental reports highlight the impacts of business management respectively on the social and ecosystem side, the sustainability report represents a synthesis of economic, social and environmental side. It allows to represent,

in a single document , several aspects by the company : financial, economic , social and environmental . For this reason, it is called triple bottom line reporting type .

The approach obtained, from the budget and from the social environment, does not allow a cross-comparison with the social consequences of environmental policy, which, instead, occurs in the construction of the sustainability report (Vaccari, 2005).

The Sustainability Report is a tool for reporting , planning and control strategy that allows the assessment of an organization according to the logic of economic efficiency , environmental protection and social protection . The usefulness of this type of instrument is linked to :

- the improvement of the government processes that allows the management of the conflict between the three variables: social, economic and environmental;
- • the improvement of the processes of integration of sector policies ;
- • analysis of conflict elements between environmental, social and economic conditions and the description of the equilibrium point reached ;
- • Increased transparency of the accountability and higher involvement of stakeholders and internal staff.
- The policies are perceived only to the extent that it is able to measure them and represent them.
- The majority of large companies reporting sustainability as an accountability tool. This does not happen in the third sector, despite the sustainability represents the main element for NPOs to be reported to its stakeholders . For this reason, this paper aims to fill the gap represented by the absence of a report widely recognized capable of representing the sustainability of NPOs.

2 Literature review

The main feature of sustainable development is its multidisciplinary approach. The Lisbon Strategy, benchmark of the European Union political commitment for economic and social renewal, promotes sustainable development in order to examine decision-making processes , the economic, social and environmental initiatives (triple bottom approach) .

Sustainability and sustainable development are current topics and the subjects of recent scientific researches.

The studies on sustainability and sustainable development have a double purpose: to limit the misuse of the term and seek effective sustainability indicators.

They implied the need to protect and safeguard of human resources, to achieve a better quality of life, the spread of greater prosperity, achieving a level of use and environmental conservation is not harmful to humans and other species and where possible a more equitable access to resources.

We talk about sustainable development when it creates situations of substantial balance between the three spheres social , economic and environmental , or if you prefer, whether it is valid the so-called rule of the balance of the three "E" : ecology , equity, economy.

Table 1: - The three aspects of sustainable development

Fonte: Johann Drèo.

This definition is absolutely antropocentric, as the core question is the ecosystem, and so not only all creatures survival but especially of human beings.

It is evident in this definition the introduction of the ethical principle of equity, it is understood in the sense intergenerational (diachronic approach) that infragenerazionale (synchronic approach) (Valeri , 2004). In other words, if up to a certain point ethics was related only to the relationship between contemporary, from a certain point you start to reflect on behaviors that one generation should have in relation to another one.

A subsequent definition of sustainable development, which instead include a more global view, was provided in 1991 by the World Conservation Union, UN Environment Programme and World Wide Fund for Nature , which identifies it as " *an improvement in the quality of life without exceeding the carrying capacity of supporting ecosystems , from which it depends.*" Loading capacity refers to the ability that a natural ecosystem has to produce, in a stable manner, the resources necessary for the species that live within it, without any risk to their survival.

In the same year the economist Hermann Daly gave a further vision of sustainability. Sustainable is a development that meets three conditions:

1. The consumption of renewable resources does not exceed its rate of regeneration;
2. Consumption of non-renewable resources is offset by the production of an equal amount of renewable resources that, in a long term, is able to replace them ;
3. The introduction of pollutants into the environment does not exceed the absorption capacity of the natural receptors.

The International Council for Local Environmental Initiatives in 1994 identified a further definition of sustainable development: "*development that offers environmental, social and economic services to all members of a community without threatening the viability of the natural systems on which depends on the provision of such services.*" The three of economic , social and environmental dimensions are closely related and each planning intervention must consider the mutual interrelationships. ICLEI ,in fact, defines sustainable development as the development that provides ecological, social and economic opportunities to all residents of a community without creating a threat to the vitality of the natural system , urban and social from which these opportunities depend.

UNESCO has expanded in 2001 the concept of sustainable development stating that "*cultural diversity is as necessary for humankind as biodiversity is for nature (...) cultural diversity is one of the roots of development, understood not only as economic growth , but also as a means to lead a life more satisfactory intellectual , emotional , moral and spiritual "* (Art 1 and 3, Universal Declaration on Cultural Diversity , UNESCO, 2001). In this vision, cultural diversity becomes the fourth pillar of sustainable development , alongside the traditional balance of the three E.

It is clear that the definitions and concepts involved in the study of sustainable development are various, but we can summarize them, basing on the approach provided by Agenda 21 in four dimensions:

1. *Environmental sustainability*, understood as the ability to maintain over time the quality and reproducibility of natural resources, to preserve biological diversity and to ensure the integrity of ecosystems. It involves the minimization of impacts on ecosystems that result in a progressive reduction of the natural heritage and the acceptability of the risks to human health;
2. *Economic sustainability* , understood as the ability to generate a sustainable income and employment and ensure a rational use of available resources. Economic efficiency

can be seen as the prerequisite for environmental sustainability are unsustainable actions involving an economic waste. The assessment of environmental sustainability can not ignore the economic evaluation, indeed, it must logically precede any environmental impact assessment, because, if the action is not economically efficient should be automatically considered environmentally unsustainable.

3. Social sustainability, understood as the ability to ensure equity in access to goods and welfare condition;

4. Institutional sustainability, understood as the ability to ensure conditions of stability, democracy, participation, information, education and justice.

In other words, sustainable development is based on an efficient integration between non-degraded natural ecosystems, advanced technologies and social systems and cultural aware and responsible (Rapisarda, 2005).

It is essential, in this context, being able to represent their sustainable path. For several years there has been widespread awareness of the impossibility of traditional economic reporting systems to represent the full complexity that characterizes all organizations (Lev, 2001; Andriessen & Tiessen, 2001; Pike et al., 2001). The informative limit of economic documents is highlighted by the impossibility to support the opinion of the stakeholders on the set of performance achieved by the company (Elkington, 1997; Kaptein & Wempe, 2002). The Enron and Parmalat cases have accelerated a process in place for several decades in which the information contained in the compulsory accounting documents have lost relevance (Collins, 2001; Francis et al., 2002; Klein & Marquardt, 2006; Lev & Zarowin, 1997); this stimulated the request for additional information (Wasley & Shuang Wu, 2006).

The compulsory accounting documents are inadequate to the information request of the stakeholders. These do not require only information related to the economic sphere. Therefore, the focus of the financial report on economic performance limits the ability to answer the existing need of information. The consequence is that the stakeholder finds an inadequate report and the management a not very good tool for the development of performance in a broad sense, i.e., according with the principles of a sustainable growth. The need to observe simultaneously the effects of any transaction on the company's performance, according with the stakeholder view, pushed manager to extend the scope of observation toward the triple bottom line (Elkington, 1997; Clarkson, 1995; Davenport, 2000). Only monitoring their performance in the extended sense allows to measure and

manage the company's sustainability (Funk , 2003; Kiernan , 2001; Wheeler, Colbert & Freeman, 2003).

The financial statements do not offer a comprehensive view of performance achieved by the company, and is therefore considered insufficient as a tool to guide business decisions (Jensen , 2001; Reynolds, Schultz & Hekman , 2006; Winn, 2001).

The expansion of corporate responsibility and the advent of the stakeholder view, has raised the urgent need to have systems for measuring and evaluating the ability of companies to balance the interests of different stakeholders. This need has led to the need for information by both the management, engaged in the development and pursuit of a social strategy of the company, both of stakeholders interested in understanding the efforts and results of the company regarding compliance of own expectations and , more generally, to the responsibility strategy pursued . This has encouraged the creation of complementary reporting systems to the financial statements, useful to express an opinion on the balance achieved in the triple bottom line (Bennett, Klinkers & James , 1999). They took source documents reporting that, at first , they saw a separation between environmental and social performance in the field , leading to the creation of two separate documents : environmental and social reports . Subsequently there has been a convergence of the two documents into a single report and looking for a single view of economic, environmental and social perspective achieved by the Triple Bottom Line (Higgins , 2002). Soon, arrived sustainability reports, especially adopted in the large for-profit companies in order to report results to stakeholders, aimed to report the joined impacts carried out by the organization (Pedrini, 2007). The Sustainability report although widespread in all sectors, remains poorly used by NPOs even if very important in these dimension of activity.

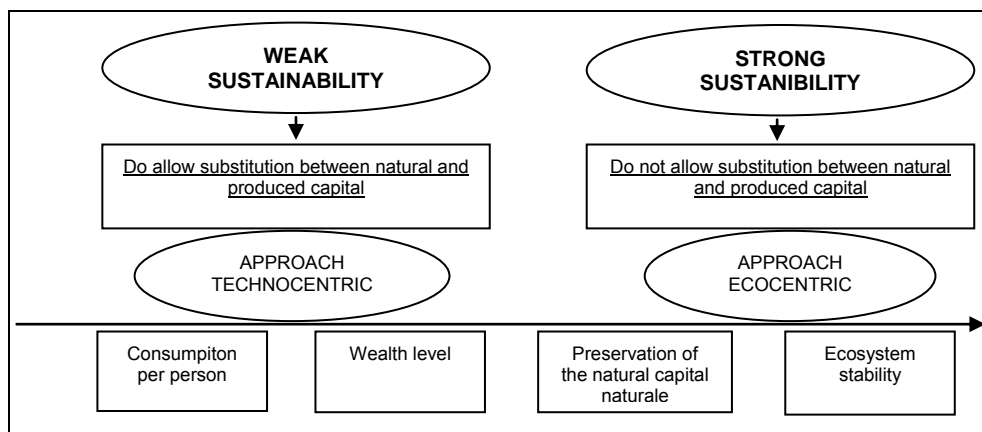

3 Sustainable development measure and assessment

About sustainability is necessary to distinguish between strong economic sustainability from weak economic sustainability. The first one needs to adopt direct measure to avoid environmental irreversible damages; according with this theory there is a strong economic development when to the growth of the capital produced by human (C) is joined a natural capital (N) not lower than the one inherited. Sustainability condition is: $\text{Var}(C) \geq 0 \cap \text{Var}(N) \geq 0$. Weak sustainability, instead, predict that will be future generation to face the environmental deriving from the action of the actual one.

Practically a sustainable growth is got when the wealthness growth so much to balance the diminution of natural wealthness caused by human activity. Weak sustainability is: $\text{Var}(C+N) \geq 0$, with C always positive (>0) instead N may assume also negative values, which consequences may be accepted thanks to C values which generate correctives able to maintain favorable life condition for human (Rapisarda, 2005).

Comparing these two types of sustainability shows that the weak sustainability assumes complementarily between the two types of capital , human and natural, thanks to the use of technology, while the strong sustainability assumes the non-substitutability of capital because it considers the natural capital is not reproducible (so-called critical natural capital) (Tenuta, 2009). In fact, neither the strong nor the weak sustainability may transcend the need for technological innovation and the knowledge of the mechanisms of the ecosphere . Only through innovative technological solutions can replace natural resources and raw materials , such as the use of alternative energy.

However, the question remains as to the degree of risk appetite on the part of both strong and weak sustainability of these types of sustainability : the first one is inclined to the conservation of the natural heritage , and the second to accelerate economic development despite the potential for impacts to global level.

Figure 2: - Sustainability classification

The instruments able to measure, monitor and represent sustainability over time and space can be economic, social and environmental (Boggia , 2007). They, in order to

support the various governmental bodies in taking decisions, are used to represent concisely the phenomenon under investigation that is very complex (Tenuta , 2009).

In the present case only a correct integration among economic, social and environmental indexes permits an evaluation of the sustainability.

The use of indicators, in fact, has an informative and evaluative function. In the first case, the indicators allow to monitor a phenomenon in order to be able to study its evolution and, based on this, define the planning choices to approaches management models easily sustainable. In the second case, they may help to simplify the results communication to the stakeholders.

From elaboration of indicators is possible to get the formulation of indices that make up the representation of a phenomenon (Berrini et al, 2000 .) The creation of parametric models is based on econometric estimation procedures. However, despite the importance of indicators is recognized globally, there are still some factors that interfere with their effectiveness. Among them within the guidelines used in their selection, the definition of significant target reference, the relationship between indicators and territorial context, environmental, cultural , in which the activity takes place subject to evaluation and , finally , how to collection and selection of data.

The selection and effectiveness of sustainability indicators is based on several factors established by the International Institute for Sustainable Development (IISD), which can be summarized in the following figure .

Table 3: - Characteristic of sustainability indicators

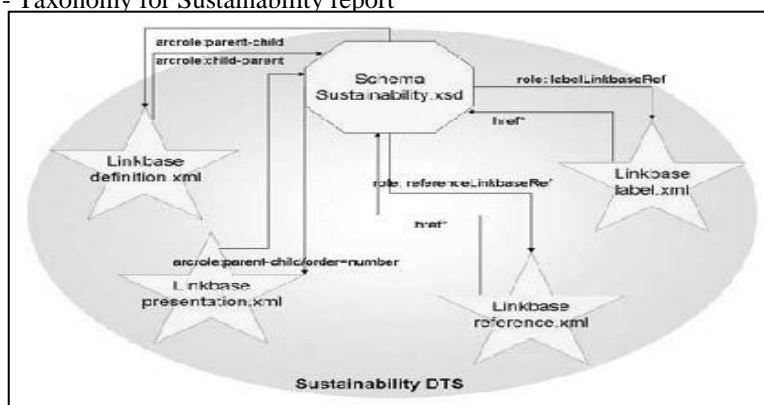

Significance	Indicators should allow to monitor the process of sustainable development and the achievement of target.
Relevance for what examined	Indicators should be relevant in the referred context .
Scientific strongness	Indicators should be based on <i>standard</i> by scientific community and should be comparable with other external information.
Misurability and convenience	Indicatori should be based on information easily reachable and accessible.
Understanding	Indicators should be easy, clear, to be understood also from not skilled people.
Sensitivity	Indicators should be adaptable to the change of the external environment in order to be sensitive at the time change.
Consistency	Should be consistent with the other indicators are part of the specific set.
Sinthesys	Must be able to synthesize in a numerical value a great number of information which refer to a complex phenomenon.
Reliability	Indicators should lead to similar results compared to other measuring instruments in respect of a given phenomenon.

Disaggregability	The indicators must be able to be broken down for the analysis of territory, in order to highlight any differences exist.
------------------	---

Source: Adapted from *International Institute for Sustainable Development (IISD)*

Despite the contribution made by the Canadian Institute two important issues are still open. The first concerns the complexity existing in the definition of targets, thresholds or reference levels needed for sustainability. The second question refers to the dynamic nature of the territory in which it operates and to the continuous change of the strategies chosen by the governments on sustainability (Stevens, 2008).

Table 4: - Taxonomy for Sustainability report

Fonte: www.e-envi2009.org/presentations/S1/Gomez.pdf

In the part relating to the linkbase *presentation* there are the methods of presentation, or the classifications of the document proposed by the GRI. In what concerns the label linkbase is assigned to each item included in the document one or more descriptive labels, the so-called label in one or more languages; these make available the same document in different languages depending on the needs of potential users of the report. Finally, the part that is the reference linkbase allows you to associate each item defined in the taxonomy scheme, normative references and external documentation which govern concepts.

4 Stakeholders' role in the sustainability representation

The environment where companies operate is organized into group of people, called stakeholders, who interact with the company as they have a legitimate interest in the activities carried on. They fix economic, social and political-institutional relationship with the company (Paris , 2003).

Company and stakeholders influence each other. In fact, stakeholders are social partners involved and may affect the company in determining its objectives; at the same time they are the beneficiary of the acts of the company as affected by economic, financial, technological, social and cultural activities put in place (Cisi , 2003).

The new objectives of environmental protection, quality of products and services offered, safety in workplace, protection of ethical and social values, are the main elements that organizations need to follow to move from a corporate profit vision to turn in a vision in which companies must integrate different stakeholders' groups needs. The documents of economic-financial nature are no longer able to meet the information needed from the actors of the environment in which companies live and work.

The need to represent the stakeholders the economic, social and environmental issues has pushed organizations to adopt control systems of their activities aimed at assessing the sustainability and environmental impact. From Agenda 21 , which placed sustainable development as a prospect to be pursued by all the world and identified actions, actors and instruments to implement the proposals in the Conference , and in particular "*... recognizes that work towards the sustainable development is the main responsibility of governments and requires strategies, policies, plans at the national level ...* ". It is from these assumptions, which later grew topics such as integrated strategic planning, consultation, community participation in decision-making, research and testing of appropriate operational tools, the solution of which are working for decades, with numerous difficulties, national and international communities at different levels. Along with these actions, there are a number of tools legally " binding ", delineated by specific EU and national directives, whose application is of great importance in the planning and design, in particular for large works. This is the Strategic Environmental Assessment (SEA) and Environmental Impact Assessment (EIA), instrument ratified by a special EU Directive and adopted in Italy since years.

To reduce the impact of production processes and encourage market choices in favor of products environmentally friendly, the European Commission has long recognized a

system of certification of products and processes to business: the main ones are EMAS, ISO 9000 and ISO 14001. They are voluntary instruments aimed at improving the environmental performance of products and services. In this context, is proposed the definition of "sustainable" as "the ability of an organization or activity, to maintain and develop their performance in the long run " through a balance between economic-financial and environmental interests.

5 Tools to assess and communicate sustainability

In recently, the complexity of the organizations and a large number of internal and external stakeholders, have made the economic-financial documents insufficient to represent all aspects with which they must deal. Traditional control systems are no longer able to represent the effects of management activities generates in the community and in relation to the reference ecosystem (Terzani, 1984).

In relation to the different realities and managerial needs, is possible to use different reporting tools. In particular, the preparation of documents ranging from ad hoc documents, in order to measure separately the social and environmental dimension (as in the case of environmental reports and social budgets), to the editing of a single document that contains, in an integrated manner, these variables (sustainability report) .

However, regardless of the type of reporting document adopted is possible to identify very relevant common features, namely the voluntary, the free structure, data representation, the monetary and non-monetary data representation (Mio, 2005). In particular, concerning the first characteristic, are documents whose preparation is not mandatory, but discretionary for the company. As regards, the social and environmental certifications, these provide accurate reporting obligations to the outside but also specific duties for their maintenance over time. However, their achievement is a voluntary action, as the information supplied in the documents displayed to stakeholders is discretionary.

Regarding the free structure, the possibility that each organization has to choose the form and the information to be included in the social or environmental document, causes multiple models of environmental and social reporting: it goes, in fact, from very concise documents (environmental report) to very detailed documents (GRI) .

With reference to the third characteristic, in the absence of mandatory requirements, it is possible to make a distinction between descriptive reports and reports containing physico-technical and economic information. It is these types of reports that take a lot of

social and environmental importance, because in them are represented, in monetary terms, environmental and social costs, investments and liabilities. The presence of quantitative-monetary information constitutes the evidence of the level of maturity reached by the management in assessing its impacts on society and on the natural ecosystem (Chirieleison , 2002; Rubino, 2004).

5.1 Environmental performance communication

The use of natural resources, caused by the various processes of industrialization that occurred during the last decades, has ignited a strong debate about environmental issues and the protection of non-renewable resources. Moreover, the effects, sometimes devastating , of human action on the ecosystem (such as rising temperatures caused by the emission of greenhouse gases) have helped to increase public awareness towards environmental risk . The result of this is an increased demand for information supplied from firms, which have had to adopt tools to give an account of the environmental dimension related to the performance of their business. Obviously, these issues require the involvement of all the developed countries, on the understanding that the current ecological crisis requires that companies also assess the pressure exerted on the ecosystem to support the new wealth for the benefit of society (added value) (Courteau , 2008; Mazzola , 2002; Bertini , 1990).

In essence, in pursuing its objectives, every organization has to comply with environmental standards the environment can not be considered only as a container of resources but a real factor of production, an essential element of company's life (Campedelli , 1998).

The need to assess on a global, national and local impacts on the natural ecosystem has led to the development of environmental reporting tools designed to control the positive and negative externalities of production activities. The environmental dimension of the company, its measurement, assessment and control do not emerge from traditional systems of analysis. Hence the need to integrate traditional reporting tools, with others in order to verify the environment variable.

Within organizations, there has been, over time, an increasing expansion of the tools available to consider the environmental variable, so is possible to say that we are witnessing the transition from a purely reactive approach, in which the organizations are

involved in environmental issues as a result of the law imposition, to an attitude of anticipation and proactive.

The results achieved by the organization and the ways in which we come to them must be adequately communicated so that stakeholders can assess the behavior adopted by the company in relation to the objectives achieved. In order to allow clear communication of objectives in different areas (social, environmental, ethical) were born a number of certifications on the management of the company; in the environmental reporting and communication tool used is the environmental report which is drawn through a set of methodologies (environmental accounting) with the aim of identifying, organizing and communicating data on the impact of the activities on the environment.

5.1.1 Enviornmental report

Negative influences on the territory, climate, human health, landscape, have always been considered secondary and marginal elements in corporate decisions. The representation of the environmental dimension is only possible through the integration of traditional instruments with an informational tool designed to assess the environmental variable in the final report. From this point of view, the environmental budget is set up as an accounting tool capable of representing the relationships between the organization and the environment. The environmental report derives its name from the equality of purpose that it has against the traditional budget in financial terms. Both instruments refer, infact, to the results obtained by the organization, over a period of time, obviously on different areas of management (Cisi , 2003).

The Environmental Report is a tool of "control" volunteer available to any organization, for profit or not, with main aim to develop a deeper understanding of environmental issues related to their management activities.

It is in the social matrix that finds its environmental balance, another important sign of the "will " to arrive at the establishment of a truly integrated information system that, as such, enables an overall evaluation "global" organization. Already in financial statements must be adequate environmental information collection, since it is here that all the content found immediate expression of the organization and, therefore, also environmental ones.

Environmental accounting was born from the need to further measure the impact of corporate decisions on the environment compared to the information supplied from the

traditional accounting tools. The existence of environmental accounting allows to assess the environmental impact of economic policies, economic development and costs paid in terms of pollution, expenses for the restoration and compensation .

The ultimate goal of environmental accounting is the construction of the environmental report as an instrument of juncture between the external environment and the organization.

From the environmental report is possible to infer the data of physical and monetary type; it describes the main relations between the organization and the environment in which are contained following indicators:

- Environmental management, which are used to assess the control activities carried out by the organization on environmental issues;
- Environmental absolute, they measure the impact factors created by the organization;
- Environmental performance, which measure the environmental efficiency;
- Potential effect, they assess effects that the activity of the company may have on the environment;
- Effect of environment, which assess the effects of the business activities on the environment generates .

Through the environmental balance will provide all stakeholders with the information necessary to understand the actions taken, the resources used and the results obtained from the organization in carrying out its activities. Those most interested in such information are:

- Customers and consumers, who verify the characteristics of eco-friendly products ;
- Workers, interested to know risks associated with its activities ;
- Environmental groups, who pay attention to the environmental consequences of each choice of the organization;
- Financial institutions and shareholders, interested in monitoring the possible causes of environmental risks;
- Local communities, who watch over the possible negative consequences of external diseconomies caused by the processes of production ;
- Government control, who are concerned with the characteristics and effects of environmental management systems adopted by organizations ;

- Suppliers, business partners , etc. . who pay attention to the possible causes of limitation in the reliability of the organization;

- Associations that oversee environmental protection on a sector basis .

The formation of the environmental report is divided into three phases:

- The first stage involves the collection of data that are subsequently the subject of observation. At the same time it provides for the classification of the data according to the objectives pursued;

- In the second phase, the collected data must be processed in order to transfer them to the environmental balance;

- In the third phase shall exchange data and information processed.

Through the environmental balance are provided to stakeholders a range of information in the environmental field in terms of: actions for environmental protection; resources deployed; expected results (Cisi , 2003).

In modern business management, the role acquired from the environment, is necessarily linked to the realization that the indiscriminate exploitation of natural resources can bring the system to the crisis of unsustainability. The company that does not take into account in its processes of the environment transfer, according to a " process of outsourcing ," its cost to the community. It is important to emphasize that, despite being a tool of "voluntary" nature, the benefits arising from the preparation of the environmental report are very important both on the management plan and image in relations with stakeholders. However, as all the documents of a voluntary nature there is not a unique schema or generally accepted methodology that make budgets homogeneous and comparable, but there is an ample discretion.

5.2 Social performance report

In a global economic environment, highly competitive and uncertain, many organizations choose to disclose to the community the impact generated by their work on the society and environment. All this is linked to the awareness that taking an ethically responsible mind is an essential source of competitive advantage. In fact, to be attentive to the social means to improve the impact caused by the conduct of the business, having regard to cure the economic, security and transparency. In doing so, the orientation put in place by the company becomes an added value that must be adequately disclosed to third parties.

The most widely used tool for reporting the contribution on the amount and quality of relations between the organization and its stakeholders is the social report. To understand the meaning of social report is useful to clarify the term. The noun report is sometimes misleading because it draws more budget, the traditional one, which shows in the classic balance sheet and income statement, assets and liabilities, income and expenses, which come from a system of a book- fixed. The social report, instead, derive from operations outside the traditional accounting schemes; is an account of the social and ethical behavior of a specific activity, with the aim of declaring the results intended and achieved, corroborated by the testimonies of the major stakeholders (Corrocher, 2005; Zamagni, 2003).

The adjective social highlights the company's focus on those who gravitate around it and as a result are influenced by the positive or negative effects of the activity performed.

In view of the foregoing, the social balance is defined as a statement of the behaviors activated and the results achieved; it represents an integration of social and ethical representation of the financial and economic financial statements (Vermiglio, 2000).

5.2.1 Social report

The social report is a tool through which an organization communicates, in a comprehensible and verifiable manner, the ways in which it operates as well as the usefulness of the activity carried out on behalf of the community. In other words, the social report is intended to provide transparent reporting of what the company has done to responsibly fulfill its commitments (Matacena, 1984).

The interest in a social accounting arisen in the various Member unevenly and to meet different needs, but all related to the need to regain the confidence of the public, customers, citizenship and savers. All this is possible thanks to accurate and transparent with regard to these subjects, more or less strangers to business management, involved in the work done by the company.

In medium/long term, in fact, have to pay attention to all those who, by their actions or reactions, can affect the economic balance of the company. For example savers who want to continue to invest in the same company, to customers who make their own choices guided by various considerations, to personnel working more or less depending on the enthusiasm and motivation that it depends on the business climate, the more

general community of reference that can take hostile attitudes in the face of behavior inattentive to the needs of all.

It is the awareness that these issues cannot be overlooked that begins to manifest itself in different situations the need to have a tool to raise awareness among various stakeholders, the impact of the activity performed. In the United States during 60s, in the wake of the movements of consumers and environmentalists, there are examples of statements which serve to highlight the behavior of socially valuable companies in order to stem, in public opinion, the impact caused by these movements themselves (Sacconi , 2005). This attitude has subsequently spread to England, France and other countries with more developed economies.

You have to wait until 90s to have a general interest on the subject that pushes the doctrine to question the form and characteristics that the social budget must have. In Italy, the first attempts at preparing the social report concerns, for example, the State Railways , the Italian Post Office , Unicredit , Telecom Group; these understood the importance of this tool (Corrocher , 2005) .

The social report is a voluntary document that can measure the results and decisions of the organization in terms of social impact on people and on environment in general.

The social reclassified, designed in 1990 by the European Institute of Social Report (IBS), is divided into three basic sections (Bianchi et al, 2001):

- Corporate identity, which identifies the values guide to direct the strategic plan and therefore the policies and choices of action;
- The cash flow statement (production and distribution of value), which indicates the economic resources produced and their distribution in the territorial context;
- The relationship of social exchange, to represent direct interactions with key stakeholders (human resources, customers and suppliers, shareholders and lenders, and state institutions, community and the environment) .

The multiplicity of approaches and the fact that it is a voluntary document have not allowed, to date, to arrive at a generally accepted model of social report. However, in the national context the reference model is the one developed from the committee for Social Reporting (GBS). This represents, at a national level, the main reference for the preparation of the report for all social organizations that voluntarily decided to give an account of their work assuming social responsibility as a point of reference in the definition of business strategy.

Apply this instrument means to assess the environmental and socio-economic performance of an organization, not only from a qualitative, but also quantitative point of view (Beda et al , 2004).

Furthermore, since the preparation of the budget comes from social voluntary action by companies, it follows that the choice of contents and structure of the arguments are quite free; this consequently cause, the final form of the product and its substance. However, there are some limits to the spread of social report, especially in the complexity of the instrument, the lack of standardization and uncertainty of results. Many organizations have produced papers aimed to normalize the phenomenon as summarized in the following table. This led to the production of different documents and, accordingly, in order to facilitate the preparation and the comparison of the results in terms of space and time, arisen the problem of standardization of this phenomenon.

In particular, the Institute of Social and Ethical Accountability (ISEA) is an international professional association founded in 1996, committed to develop a culture of social responsibility and ethical behavior in business and nonprofit organizations. In November 1999, he conceived the AA1000 process standard. The Global Reporting Initiative (GRI) was born in 1997 to a meeting organized by CERES (Coalition for Environmentally Responsible Economies) in partnership with UNEP (United Nations Environmental Programme), has promoted the Sustainability Reporting Guidelines on Economic, Environmental and Social Performance. The Council for Economic Priorities Accreditation Agency (CEPAA) is a company accreditation for ethical certification

which is an emanation of the Council of Economic Priorities (CEP), the U.S. institution founded in 1969 to provide investors and consumers with information tools able to analyze the social performance of companies. In 1997 it adopted the SA8000 standard which covers seven reporting areas: child labor, health and safety, freedom of association and union representation, discrimination (racial or sexual) , disciplinary practices, (corporal and psychological punishment , insults), working time (overtime forced, working holiday) and minimum wages. So it is a standard international certification which covers, in particular, respect for human rights and workers' protection against the exploitation of children and guarantees of safety and health in the workplace. Excludes, therefore , the environmental and economic aspects of management.

The SEAN / KPMG has focused, instead, the formulation of an industry standard for banks.

The Res - Q group is a working group formed at the initiative of CELE (Centre for Ethics Law & Economics) with the aim to propose a model of management of the company by establishing a standard of ethical and social responsibility of companies.

The Ministry of Labour and Social Affairs, in collaboration with Bocconi University, has established a working group for the preparation of a standard of social performance indicators contained in the document CSR-SC .

Not all of these documents concern the social report; in fact, is necessary to distinguish between content and process standards where the first aim to normalize the management cycle in order to make it economically and socially responsible (AA1000 documents and RES - Q) while the latter directly detect and normalize the actual contents of social document (GRI documents , GBS and Guidelines of CSR Europe) (Rusconi et al 2004) .

The document SA8000 is, instead, one international certification standards of content whose reference scope is limited only to human resources and not to the company as a whole.

In Italy, several models have been proposed capital budget that can be traced to two approaches; as mentioned above, one is oriented to stakeholders (typical of cooperatives) while the other is prepared according to the reclassification procedure.

5.3 Sustainability measurement and representation

A socially responsible organization is sustainable that means to pursue a development jointly social, economic and environmental.

The growing attention to sustainability and the need to account it to the stakeholders has led to the development of models to measure and report it, through the use of a set of economic, environmental and social measures that assess the impacts produced by the company in an integrated way. The sustainability report is a document that illustrates the impacts that the activity generates on the economic, social and environmental side.

While the budget measure the social and environmental effects of the social and environmental policies carried out by the company, the sustainability report is a tool for reporting, strategic planning and control in order to assess an organization according to the logic of economic efficiency, social and environmental protection.

Sustainability reporting is not only a tool for reporting but it is also a tool for strategic planning and control that enables you to evaluate an organization according to the logic of economic efficiency, environmental protection and social (Tenuta , 2009). It allows improving the processes of governance of the company as it enables the management of the conflict between the variables of social, environmental and economic issues and, at the same time ensures greater transparency in reporting, which translates into greater stakeholder satisfaction.

5.3.1 A standard sustainability communication: Global Reporting Initiative (GRI)

The need to achieve a common standard of sustainability reporting has led to the use of the Sustainability Reporting Guidelines on Economic, Environmental and Social Performance, developed by the Global Reporting Initiative.

The sustainability report, which is based on the GRI Framework, aims to highlight the results and effects with respect to commitments, strategies and methods of management of the organization. It can be used to make benchmark comparisons, than provided by law or voluntary initiatives, both to demonstrate how the company influences and is influenced by expectations about sustainable development, and to compare its performance across the time or respect with different companies.

The GRI Framework is the model of reference for reporting on economic, environmental, and social organization, regardless of size, sector of activity or country of

origin. In order to facilitate the application of this model have been developed guidelines that represent the main international reference for the preparation of sustainability reports.

The Sustainability Reporting Guidelines are applied in any company, public or private, profit or non-profit, large or small. However, there is the awareness that it is not possible to adopt the same model for all. We have tried, as well, to meet the needs of customization through the provision of a number of the documents that integrate the relevance of the guidelines. These documents are (Campedelli, 2005; Mulazzani, 2000):

- The sector supplements, or additions to the guidelines referring to organizations operating in particular sectors (automotive, financial services, tour operations , telecommunications , minimum and metals , public agency) ;
- The technical protocols that relate to specific indicators proposed by the GRI and have the function of supporting procedures and formulas relating to the latter (child labor, energy , water , boundaries and health & safety) ;
- The issue guidance documents, which relates to issues and insights about the diversity, productivity, and so on.

The GRI sets forth the principles that organizations must follow in the process of preparation of the sustainability report. In order to improve and facilitate the understanding of the framework, we proceed to an articulation of the principles in two groups namely the principles of definition of the content and principles of the quality of the report.

The definition of the report's content states that the social information must comply with the principle of materiality, completeness, transparency, inclusiveness of the stakeholders and the context of sustainability.

On the basis of the first principle, the information contained in the report must refer to the topics and indicators that reflect the significant impacts (from the point of view of social, environmental and economic), or that may influence the assessments and decisions of stakeholders in a major way. Therefore, the report should be entered only the information reasonably important in reflecting the social, environmental and economic aspects of the company that may influence the decisions of stakeholders. Materiality is the threshold beyond which a topic or indicator becomes sufficiently important to be included in the report; to determine whether information is relevant must combine external and internal factors, as company's mission or the influence of the same entity on the upstream (supply chain) and downstream (customers). The impacts, however, are

considered significant if they are of concern to the community of experts or those identified using established tools . The second principle implies the open explanation of the procedures adopted in the process of reporting, while the third is based on the systematic consultation of stakeholders in the process of reporting and accountability of economic, social and environmental. In essence, the company must identify its stakeholders and highlight, in the report, the modes by which it met their expectations. The involvement of these parties increases the responsibility for them and mutual trust, strengthening, thus , the credibility of the report. The context of the principle of sustainability is based on the belief that corporate performance has a significant impact on the distribution of value (economic, environmental and social) at all levels (local, regional and global). Since here the necessity to place its performance in a social and environmental context. Finally, the principle of completeness in the quality of the information contained in the report of sustainability requires the inclusion of detailed and consistent with the company's operational boundaries and temporal areas of the report. In practice, the contents of the report should be sufficient to reflect significant economic, environmental and social impacts in such a way as to allow stakeholders to express an opinion on the performance of the organization of the reporting period. Specifically, the completeness relates to the objective (which refers to the topics covered in the sustainability report), the perimeter (with whom he defines the set of entities whose performance is represented in the report) and the timing (the need for information taken as a reference are complete in relation to the period of time specified in the report itself).

The principles to guarantee the quality of the report are aimed at strengthening the security and the reasonableness of the evaluation of business performance by stakeholders. The quality of the report is only guaranteed by the principle of balance, comparability, accuracy, timeliness, clarity and reliability. Compliance with the first principle is to avoid preferences in the selection and presentation of information, and through a consideration of the results favorable and unfavorable, aims to provide a balanced picture of corporate performance. The second encourages the comparison of economic performance, social and environmental enterprise over time. In order to make a correct comparison is necessary for the company to maintain unchanged the criteria used for comparison (operating limits, amplitude and temporal). Any change must be communicated to them by implementing, in conjunction, the changes necessary to ensure compliance with this principle. If there are problems that do not allow the company to

operate in this sense should inform and explain the reasons. The principle of the accuracy guarantees the acquisition of a higher level of accuracy of qualitative and quantitative information contained in the financial sustainability through a detailed indication on approaches , methods and techniques used in the construction of the report. The content of the latter must be detailed so as to enable the addressees of the document to form an idea about the performance of the company. The characteristics that determine the accuracy of the information varies depending on the nature of the information itself, so it is necessary to indicate in the report , approaches , methods and techniques used to collect and process data (Carnevale , 2005). The fourth principle refers to the frequency with which the sustainability report is to be published. Given the close connection of the reporting tool with the financial statements, it is appropriate, for companies, it is compiled and published by the same periodically scheduled for the economic-financial balance, ie annually. The periodic disclosure of the information contained herein will provide valuable support to the decision-making process of various stakeholders. Any updates will be released later with interim basis bearing in mind, in the latter case , the level of importance of the information and the opportunity cost of disclosure / non-disclosure of the same . The fifth principle promotes understandability, accessibility and intelligibility of information in order to ensure their access to the greatest number of users without , however, compromising the highest level of specificity of the data. Finally, the principle of reliability is the foundation of the whole process of the sustainability report ; it pertains to the detection systems , management, communication and control of information and is supported also by the possibility provided in the GRI , to submit the report of sustainability certification using the processes of internal audit and the external audit of its own .

The first part of the line also includes a guide to the definition of the content of the report and the definition of the perimeter. The contents of the report should be decided considering the purpose and company's experience and expectations of the various stakeholders. To this end, through the use of the principles mentioned above, we must identify the arguments and the relevant indicators worthy of being included in the report. The perimeter, instead, refers to the various entities whose performance is discussed in the sustainability report which will, therefore, contain not only all entities that generate a significant impact on the company as well as those over which it exercises control or ' significant influence on financial and operating policies (Carnevale, et al 2008).

The GRI shall also define the minimum content of the sustainability report. The structure consists of four sections related to strategy and analysis, the profile of the organization, report parameters, Governance, commitments and engagement of stakeholders.

In the first section, defined strategy and profile, there is a description of the strategic relationship between organization, sustainability and social commitment.

The second section (profile of the organization) address the demographic information (name, operational structure, company size , ownership and legal form , main brands, the nature of markets served) as well as those inherent in sustainability management systems implemented by the organization (significant changes occurred in the reporting period, honors / awards received in the reporting period) .

The third section (profile of the organization) includes information related to the profile of the financial statements (the reporting period, the date of publication of sustainability reports, frequency of reporting), objective and scope of the report (information pertaining to joint venture activities outsourcing that can significantly affect comparability between periods and organizations, significant changes in the scope, boundary or measurement method) , the policies of external assurance of the sustainability report .

The fourth section, finally, contain a description of the strategic and operational decision-making processes implemented by the organization to ensure maximum involvement of the various stakeholders in the circuit of sustainability. Among these include the description of the corporate governance (indication of the role played by the President, the number of independent directors and / or non-executive directors, etc.). , Commitments and external initiatives (adherence to international standards of social and environmental management or certifications obtained, participation in national trade associations and / or international) , the involvement of stakeholders and so on (Molteni , 2004; Rappaport , 1989).

In this section find space, too, the performance indicators used to provide an immediate and concise information regarding the economic, social and environmental issues related to the activities of reference and in general on the performance according to the triple bottom line approach. In particular, there is a distinction between core indicators and additional indicators; the first (performance indicators) are essential and are used in different types of organization and for most of the social partners, while the latter are used

by a limited number of companies and provide specific information targeted at the stakeholders particularly important. The indicators thus defined are divided into indicators of economic performance, environmental and social (Beedle et al , 2004). The first measure impacts in terms of economic organization towards its stakeholder, in terms of both monetary and non-monetary flows. The second estimate quantitatively the impact produced by the enterprise on the environment in terms of use of inputs (resources and alternative sources) and the management of waste output (waste, emissions, waste). Finally, the third measure the impact of the organization in the social context in which it operates.

In addition, the model provides a self-assessment of the GRI reporting level achieved, which arises from a voluntary statement about the content of the report and the guidelines followed in accordance with the GRI application levels. The levels of application of the Global Reporting Initiative are three (A, B, C), to which you can add a (+) self-assessment of their level of reporting (Tenuta, 2009).

6 NPOs in Italy

The increasing importance of the third sector has taken the Italian legislature to turn its attention to the vast and varied universe of nonprofit organizations. So to the general civil law, which is contained in the few articles of Book I of the Civil Code of 1942, the legislature has added over the past few decades, a special discipline. From the legal point of view, and according to the International classification of Non Profit Organizations include 12 different groups:

- Culture and recreation
- Education and research
- Health
- Social services
- Environment
- Development and housing
- Law, advocacy, politics
- Philanthropic intermediaries and voluntarism promotion
- International
- Religion
- Business and professional associations and unions

- Organization not elsewhere classified.

This classification represent a large range of activities in the non profit fields, highlights the diversity in the sector and suggests that there are many different issues to face across the *NPOs* sector.

From a tax point of view non-profit organizations can be "non-commercial entities " or " non-profit " governed by Legislative Decree December 4, 1997, n . 460. The measure has defined some of the characters and backgrounds typical of companies operating non-profit organization, such as:

- The prohibition of distribution of any profit;
- The obligation to transfer of the assets of the entity in the event of its dissolution to another association with similar purposes or for public purposes;
- Uniformity and effectiveness of the associative relationship;
- The obligation to draw up and approve an annual economic and financial report;
- Free eligibility of the administrative bodies, the principle of the single vote, the sovereignty of the shareholders and associates;
- In transmissibility of membership dues;
- Carrying out activities in the fields of social welfare and social care, health care, charity, education, training, amateur sport , protection , promotion and enhancement of the things of artistic and historical interest , the protection and enhancement nature and the environment , with the exception of recycling of municipal waste , the promotion of art and culture , the protection of civil rights , scientific research of particular social interest ;

The third sector includes a variety of different organizations and associations, is active in many areas of economy ranging from healthcare, social services, employment and culture to environment (OECD, 2003). Compared with private companies the characteristics of *NPOs* include the following:

- Are value-driven, instead of profit-driven;
- Stress the local dimension in their activities;
- Provide and develop services based on needs which are often not recognized by public authorities;
- Offer not only services for clients but also often do community work and/or advocacy work;
- Train and engage volunteers as part of the service staff;

- May have a special approach in their work, e.g. social goal, value goals,
- Empowerment or religious approach. (Borzaga and Santuari, 2003).

NPOs are increasingly involved in welfare, health care, education reform, and public-private partnerships and rural and urban planners use nonprofit and community organizations for local development and regeneration.

All these developments suggest that *NPOs* are part of the transformation of societies from industrial to post-industrial, and from a world of nation-states to one of transnational, even global, economies and societies, where the local level nonetheless achieves greater relevance and independence. The full recognition of the immensely elevated position and role of *NPOs* at the beginning of the twenty-first century is the main difference to the latter part of the previous century, when nonprofits were “(re)discovered” as providers of human services in a welfare state context. *NPOs* are now seen as a part of the wider civil society and welfare systems of modern societies.

The phenomenon of non-profit has grown not only because of the crisis of the *Welfare State*, but also because of a variety of factors, among which we can include:

- Economic development as well as rising incomes, has led to an increase in activity as a result of voluntary and charitable;
- The emergence of new needs and the different and specific services;
- Increasing employment and economic in this sector.

This situation has been favored by the spontaneity and good will of many citizens, who have joined together in groups (associations, cooperatives etc.) in order to provide answers to serious social problems. (Chaminade & Catusus, 2007).

According to the latest census ISTAT (ISTAT, 2011;) the *NPOs* are active in Italy 301 191 and their spatial distribution is quite uneven. 55.2% of *NPOs* is present in northern Italy, 21.5% in the Centre and 16.6% are located in the South.

If the number of active *NPOs* is placed in relation to the resident population in the same year, we note that in Italy there are *NPOs* 38.4 per 10 thousand inhabitants.

This ratio tends to be higher in the northern and central regions (respectively equal to 44.0 and 42.3 per 10 thousand inhabitants institutions), while in the South it presents significantly lower (29.4 per 10 thousand inhabitants institutions).

Today, *NPOs* regularly find themselves sharing the same territory with for-profit organizations, sometimes as collaborators, but probably more often as competitors (Ryan, 1999). *NPOs* are now expected to adopt for-profit competitive strategy approaches

(Weerawardena and Sullivan-Mort, 2001). An *NPOs* gains competitive advantage when it consistently outperforms its competitors, although this performance is not measured in the same manner as it is in for-profit organizations.

Today, as physical assets and financial capital are no longer the primary resources that facilitate competitive advantage but the intangible and the IC resource represent the only one to ensure a competitive advantage (Kaplan and Norton, 2001; Wall et al., 2004)

Nowadays, the role and contribution of *NPOs* are more important and strategic. Various circumstances place *NPOs* activities in competitive environment and require a complex management. This makes the demand of *NPOs* management should be conducted in a more professional, modern, and use the concepts of strategic management. In fact, the performance measurement models that have been developed are tend to profit-oriented organizations, while performance measurement model according to the characteristics of *NPOs* is still relatively limited. The lack of this limitation, is inadequacy the stage of identify and determine the aspects of *NPOs* interaction with internal and external parties that demands of higher levels of capabilities (the need for the level of the knowledge based organization). While the difficulties to develop a mechanism of quantify intangible assets elements, is the intangibility of the leading indicators that expected to perform quantitative value of organizational performance achievement. This constructive research is to develop a performance measurement model according to the characteristics of *NPOs* based on the intellectual capital.

Table 6: - *NPOs Geographic breakdown*

	2011			
	V.A	%	Per 10 inhabitants	Var. % 2011/2001

The fundamental difference between the *NPOs* with Profit Organization is situated on the main reason of the establishment of the organization. In simple terms it can be said that the main purpose of Profit Organization is to create financial gain for its owners through profits from the goods/services traded. On the other side the main purpose of the *NPOs* is to meet the social needs of a community or of its members. In return, the *NPOs* not only provide services that are owned but also need to consider all the consequences arising from the services they have. Therefore there is a difference between the groups perspective Profit Organization *NPOs*. Here are the general differences between Profit Organization and Non-Profit Organization.

Table 7: - Differentiation between Profit Organization n Non-Profit Organization

Profit Organization	Non-Profit Organization
Focus on marketing operation line (bottom line)	Focus on social requirement
Aims to create value for shareholders	Aims to create value for the needy
Employee hiring to run the company	The volunteers who run the organization
Source of revenue comes from sales of products and services	Source of revenue comes from contributions from donors and government funding

7 Sustainability report and third sectors

If the financial information in any case constitute an important benchmark for performance evaluation carried out by profit-oriented enterprises, their information capacity is , however, limited in the context of non-profit organizations , with reference to which it is necessary to consider also the contribution they make in terms of improving the social welfare of specific categories of individuals and / or communities and their impact on the environment.

If the financial statements have limitations, the role it plays, however, is different depending on whether it refers to a company or a NPOs. The success of NPOs does not relate to measures of economic-financial order, so the final amount may not be able to express a sufficient measure of the performance levels achieved. A report of management is able to attest to the nonprofit organization's ability to achieve the given conditions of equilibrium during a reporting period, but nothing expresses with regard to the achievement of the goals that inspire action.

If in case the sustainability of the company 's financial statements may be given as a supplement to reporting financial position and, in the case of NPOs sustainable attribute appears more properly refers to the entire action , including the management of the budget, and the possibility that it becomes really object of analysis, commentary and collective evaluation . Reporting sustainable is not a key additional or residual action of NPOs but the original one.

From this point of view, the introduction of the sustainability in NPOs can be considered as a possible response to :

- Lack of transparency regarding the activities and achievements of organizations, which does not allow stakeholders to really evaluate the performance with respect to the pursuit of the mission ;
- Lack of clarification of the objectives and strategies of NPOs , which should be the starting point for the definition of the objectives , but they are often not the result of a systematic and thorough process of strategy formulation and identification of priorities;
- Lack of performance measurement, much more oriented to the correct recognition of accounting phenomena than to the systematic measurement of performance in terms of service quality and effectiveness of interventions;
- Lack of communication, which makes it easily accessible on the outside , if available, and does not allow stakeholders to appreciate (in the sense of giving value) efforts and results actually achieved by NPOs (Di Filippo et al, 2008)

8 Scope of the research

The current reporting documents used by NPOs relates only to the social budget. The non-profit sector is in late in the consciousness of the strategic importance of the representation of their sustainability in order to create and manage knowledge and to enhance the value of the organization.

The present work aims to identify a new framework for the sustainability report, which can be used, by all NPOs and it is expressive of the operating characteristics of each. The new report should be the main mechanism that NPOs can use both inside the structure, to support the strategic management of knowledge, and outside, to communicate to stakeholders the impact of integrated triple bottom line (economic, social and environmental).

9 Hypotheses Testing Conclusions

NPOs do not prepare their financial sustainability report and this is a limit. We believe that the use of an integrated approach to economic, social and environmental is a benefit for the third sector as it helps to represent in a more clear and complete way the development of a sustainable organization.

The hypotheses of the research are:

1. Implementation of a sustainability report encourages the representation of economic, social and environmental organization products, especially in a sustainable NPO in which the reporting is a key element. It is an essential element in the governance of the organization because it promotes an overview of the activities carried out;

2. Using sustainability report favors the process of interaction between stakeholders and the NPOs. It is an essential element for the stakeholders because it promotes overview of the activities carried out.

10 Methodology. Research Framework

The present research is divided in two parts: first is theoretical and is focused on sustainability concept, sustainable development and NPOs characteristics.

Is analyzed the Triple Bottom Line integrated approach as well as tools required to represent the economic, social and environmental organizations in general and in particular NPOs.

In this first descriptive approach , after having shown that it is necessary to represent its stakeholders in an integrated manner the results of its activities in terms of economic, social and environmental issues, is highlighted the absence of a generally accepted framework for the representation of the sustainable impact of the expansion of the third sector organizations.

In the second part of an empirical nature, based on best international practices and in line with the provisions of the GBS and the GRI, is constructed a new framework for NPOs' sustainability reporting of. Subsequently ensure compliance with this sustainability report to a case study.

The empirical analysis consists of two steps. First, a quantitative analysis was performed on the reporting tools available on-line and refer to non-profit organizations with particular reference to those involved in volunteering. The consultations available online it is found, with reference to our country, that the third sector use, where this is done, only models of representation of the social impact of its activities as an integrated approach to triple bottom line (economic, social and environmental). On the basis of the GRI Sustainability Reporting and based on the information and reports prepared by the GBS, has been implemented a first draft of ad hoc reports for the representation of the sustainability of all third sector organizations. Subsequently, it is also looked at the sustainability reports of for-profit enterprises to understand what indicators could be extrapolated and implemented to represent and improve the communication skills of both NPOs with the territory, but also with other geographical areas.

Based on all the information gathered, together with the literature on the subject has been prepared for a new framework for the sustainability of NPOs consists of 26 macro-economic indicators, environmental and social, with indication of where possible correspondence with the GRI indicators.

The choice of the case study for the application of sustainability reports is on a Centre for Voluntary Service (CSV) because for functions and structure includes, in a wide view, all variables environmental, economic and social monitoring of any NPOs.

The choice to analyze the case study of the Province of Cosenza CSV is to be found in the growing concern of the generality of NPOs, to have objective evidence about the quality of services provided and the economic, social and environmental impacts of the activities carried out in the context. The CSV is a valuable point of reference for all NPOs in the area; the implementation of a new framework for the sustainability report of the CSV of the Province of Cosenza could lead to a further extension of the instrument to other NPOs that are addressed to it.

Table 8: - Framework

	FRAMEWORK	CSV INFORMATION
IDENTITY	Provide quantitative data to be used to analyze organization's profile and services supplied	describe the composition of the corporate center and the services provided to the various non-profit organizations users of the services.
ECONOMIC DIMENSION	The economic dimension analyzes the economic impacts on the stakeholders and on local economic systems	Integrated analysis of income and expenses by more specific indicators (such as fundraising, development and impact of investments for public benefit, pension plans for employees).
SOCIAL DIMENSION	The social dimension reflects the impact of the organization on the social systems in which it operates	The social dimension is the one that analyzes the impacts on society and the treatment of employees, as well as analyzing the working conditions and discriminatory practices.
ENVIRONMENTAL DIMENSION	The size affects the environmental impact of the organization on living and non-living natural systems.	The environmental dimension, in a limited way as many indicators are not currently measured by NPOs, provides relevant information on best practices implemented on the consumption of paper, etc.

11 CSV Introduction

The CSV - Centre for Voluntary Service - is a organism provided by the Law on Volunteering (L.266/91) run by Volontà Solidale which is an Association of Associations, a non-profit organization , which has been tasked to support, promote and qualify the activities of the Volunteer in the provinces of Italy where it is present. In 2010, members of the service centers were 9,409, an average of 121 members for CSV. In Calabria, the number of members is equal to 481, with an average number of members per center of 96.

11.1 Historical reasons for the CSV

The CSV Cosenza, funded by the Special Fund for Voluntary Service, operating since 2003 in accordance with the principles of " subsidiarity " and " empowerment " to promote the role of active citizenship in building a more cohesive society and to ensure the protection of the Common Good . Enhance the human resources of the voluntary and enables active citizens of the province of Cosenza of being and doing volunteer work. At the end of March 2014, the CSV of Cosenza operates with 16 employees including 13 part- time employees and 3 employees to the project as permanent collaborators of the Centre. In 2013, subscribed to the CSV of the Province of Cosenza 608 NPOs. A special

note is the strategic body of directors that sets goals and strategies to pursue. It is composed of 21 members with a frequency of 7 meeting per year.

The following entities may apply to CSV and receive services free of charge, within the limits and under the conditions stated in the guidelines,:

Voluntary organizations operating in the province registered or not registered in the register of volunteer work, and individual volunteers who work in them;

Coordination and volunteer networks thematic and territorial;

Groups of people who want to set up an organization to volunteer ;

Would-be volunteers ;

Citizens who want to be involved in the promotion of a culture of solidarity;

Subjects of the third sector and of public bodies that can provide information and guidance on issues relating to volunteerism.

It is clear, therefore, that the CSV supports the practical world of Volunteering through the provision of a number of different services; from basic services, promotion, advice and professional assistance, services, training, documentation, communication and social planning. (table 3)

Fonte: nostra elaborazione

The CSV Cosenza organizes meetings, seminars and training days on topics of interest for the Voluntary and supports the implementation of training programs of the Associations. The service of Education wants to qualify the skills of volunteers or would-be volunteers, foster the exchange of experiences and improve the capabilities of the Associations. As of 31/12/2012, the CSV has surveyed about 1,700 between associations and other organizations of the Third Sector operating in the province of Cosenza; of these:

584 were found to have the requirements of the Law 266/91 (Voluntary Organizations);

432 are volunteer organizations that have turned to the center (74% of voluntary organizations surveyed);

311 are recorded at the Regional Registry of Volunteers;
250 between volunteer organizations recognized at RRV have turned to the center (equal to 80% of the members).

12 Results of hypotheses testing and limits of the research

The advent of the stakeholder view has led to the need to have systems for measuring and evaluating the ability of companies to balance the interests of stakeholders. This need has led to the emergence of new needs for information by both the management, engaged in the development and pursuit of a social strategy of the company, both of stakeholders, interested parties fully understand the commitment and achievements of the company regarding compliance of her own expectations and, more generally, to the responsibility strategy pursued. This has encouraged the creation of reporting systems and complementary to the financial statements useful to express an opinion on the balance achieved in the integrated triple bottom line.

The sustainability report compiled by the CSV of the Province of Cosenza is a tool that can bridge the information gap and anchor the strategic objectives of the objectives of the single CSV NPOs. Through the new sustainability report CSV has been able to:

Identify and map all the activities carried out;

Improving the perception of those who govern the service center on what has been done and what can be done in particular on compliance with certain environmental objectives;

Improving the perception of employees on activities in order to increase the motivation to work;

Improving the perception of all stakeholders (citizens, associations, institutions, etc. .) on activities.

The hypotheses of the research are definitely confirmed. The new sustainability report is intended by the CSV of the Province of Cosenza as a management tool that allows you to monitor the evolution of relations between the CSV and the community; increases the diffusion of knowledge within and outside if properly used and allows a transparent communication with all stakeholders of the performance and organizational skills.

The sustainability report allows the CSV to improve their performance by providing useful information to those interested in the organization. The sharing of knowledge management tools and knowledge allows the improvement of the effectiveness and

efficiency of the services provided and improved organizational stability of the CSV. The sustainability report requires little interpretation, when used and disseminated within and outside the CSV encourages the sharing of resources rather than competing for resources. This is because due to a change in behavior and values of the people of what is good and what is bad for the organization of what is right and what is wrong to do.

This work helps to build a nascent body of literature that suggests that the sustainability report can be used as a conceptual framework for the management and strategic competent representation in all NPOs .

The results of the empirical study are limited by the implementation of sustainability reporting in a single case study. Therefore, even if the job reaches concrete results, the presence of a single organization analyzed reduces and limits the results obtained. In addition, notes the presence of other similar bodies to CSV in several European countries, the report need to be better deployed in other European contexts .

Strategic prospective methodology for to explore sustainable futures

Guillermo Gándara

Departamento de Relaciones Internacionales y Ciencia Política
Tecnológico de Monterrey
Av. Eugenio Garza Sada No. 2501
64849, Monterrey, N.L. México

Structured Abstract

Purpose – Show the prospective methodology as a tool to generate strategic knowledge for the design of sustainable futures.

Design/methodology/approach – Prospective Strategic is a Social Science discipline dedicate to explore the future. Based on qualitative methods whit participative stakeholders' permits design different future options and planning the transformation from actual scenario to desired future. We propose a four stages methodology process for the design sustainable futures: first understanding the context, followed by a strategic visualization, to continue the stage design the alternative sceneries and define the desired future, and finally concludes planning its construction.

Originality/value – This methodology puts in evidence the possibility of seeking alternative scenarios for a sustainable future in different ambits. Particularly we resume three prospective applications: biodiversity conservations and treatments water.

Practical implications – The outcomes of the application have been allowed to propose strategies and policies for environmental goods management such as environmental services and reuse water, with a long time vision based on a collective desiderated future.

Keywords – future studies, scenario methodology, strategic prospective, future sceneries, future.

Paper type – Academic Research Paper

1 Introduction

The field of futures studies is relatively young. Although man has always tried to anticipate the future, serious, systematic and rigorous reflection on it dates only to the half last century. Prospective attempts to explore where reasonably could lead trends and alternatives of action or inaction that we have in the present and in the future. (Alonso, 2014)

A world where poverty persists, the wealth is concentrated; corruption, organized crime, debt and economic insecurity increase; where pollution and mismanagement of natural resources problems are compounded; where environmental viability for our life support is diminishing and climate change continues; can't be satisfied with his present. According to the report on the future *State of the Future 2012* of the Millennium Project without a serious focus on green growth, falling under water systems, rising food prices, water and energy, population growth, resource depletion, climate change, terrorism and the changing patterns of disease, are likely catastrophic results worldwide and will force in the coming decades, migration, whereby large the world will become increasingly unstable (Glenn *et. all*, 2012).

Since the industrial revolution, the conventional development model had an approach in which the modernization development simply considered as following the standards set by an industrialized society, regardless of the consent and efficient use of resources, assuming the deterioration thereof as an inevitable consequence of development. Facing these challenges, a new development model has emerged to replace the old paradigm of industrial development. As noted by Baker (2006) this model of development "has sought to integrate and reconcile economic activity, social progress and environmental protection within a holistic model that enables the development and promotion of human welfare without having to rely on the destruction of resources."

In this new model of development has integrated the concept of sustainability, which has evolved since its first application, documented in the renewal of the mandate of the International Union for the Conservation of Nature and Natural Resources in 1969, reaching one of the definitions most accepted of sustainable development. Embodied in the report *Our Common Future* by the World Commission on Environment and Development, it establishes that sustainable development implies "meeting present needs without compromising the ability of future generations to meet their own needs" (WCDE, 1987).

From sustainable development and strategic prospective perspectives are presented below two future studies cases. The first presents scenarios for the conservation of a bat species (*Tadarida brasiliensis*) living in northeastern Mexico with the problem of declining bat colony. The second case presents scenarios for the use of treated water in the city of Monterrey, Mexico face the challenge of water stress in a semi-desert area.

2 The Future studies

There are two major future studies visions: first, the deterministic current that premium to the past as the main determinant of the future and considers the phenomena that show verifiable behavior historically. As mentioned Mojica (1999), future is the son of the past. The other stream, the voluntarism, consider building the future as a result of human action, which makes possible that this future will be designed and modified by proactive (Miklos & Tello, 2006). In this sense, Mojica (1999) speaks of the "voluntarism oxygen" to highlight this creative force of man, related to the notion of freedom, to work in one way or another. While the current deterministic served most from tools aimed at knowledge and explanation of the factors of inertia and trend situations, the tools of current voluntarism mostly considered a dynamic approach that is necessary to provide instruments to identify first instance the current system status and then those elements conditions for construction and achieving the desired future. The future is represented in form of scenarios.

For Godet & Durance (2007) "A scenario is a set consisting of a description of a future situation events and a path for moving from the original situation to another future." A scenario is a story with a plausible cause and effect links that connect a future condition with the present, illustrating decisions, key events and consequences throughout the narrative. Scenarios can be exploratory or normative. The first takes into account the present situation and trends to predict the most likely future. Normative scenarios seek collective construction of the future to achieve the most desirable situation. (Glenn, 2009) Among a long list of events that could happen, some are recognized more likely to occur than others. "The likely scenario tells us where we are going. But where we are going is not necessarily where we want to go. The alternative scenarios tell us that there are other paths and roads, the analysis enables us to choose the best." (Mojica, 2005)

Whether the disciplines that frame different methodologies or by the type or origin of information available for the study, methods of approach to the future can be classified on a continuum from the quantitative to the qualitative. Thus, the left side is represented by the forecast, while on the right opposite, we have the prospective. We have for example, quantitative methods such as time series analysis, where futures are mostly conditioned by past patterns showing the series of numerical data. Moreover, the qualitative extreme future will be mainly the result of analysis and interpretation to make it specialists or experts. In the middle we have methodologies that incorporate information from both

quantitative and qualitative nature, where the future is determined by the causal - effect or input- output between the variables that determine the object of study. (Gándara, 2014)

2.1 The prospective process

A future study may be conceived and developed through a comprehensive four-step methodological process. The first stage concerns the global understanding of the context; the second, a strategic view; the third stage is the design of future; and the fourth step to building the future. (Gándara, 2014)

Understanding of the context in the first approach gives the object of study. Refers to the general understanding of the problem or the object of study for the future will be displayed. It means understanding the dimensions of the system. In terms of qualitative methods, if the study requires consultation of experts are here to learn how to communicate with them. In terms of quantitative methods, refers to the identification of variables, observation and understanding of their past behavior and establishing causal relationships between variables. Understanding the context, in other words, means having a macro-level understanding from an observation point at surface level.

After the general understanding, it is possible to sharpen the focus of observation to determine the relative importance of the constituent elements under study may determine its future evolution, this is a strategic visualization. In terms of qualitative methods, refers to both the analysis and categorization of variables and relationships between players, such as the determination of strategic internal and external factors of future factors. In terms of quantitative methods concerns the validation and quantification of the causal relationships between variables, and to identify patterns and analyze their internal composition and its impacts in the future. Strategic display, in other words, it means having an understanding at the micro level tuning the degree of observation from an internal level.

After completing the first two stages of the prospective process, are sufficient to get into futures elements under study. The third stage Drawing the Futures start design allows different scenarios for the future. Whether through the exploratory approach or regulatory approach, it is time to make use of strategic information resulting in the first and second stages to display the possible future states and draw either alternative scenarios or, plausible scenarios. This is the period of greatest creativity because here the stories he tells each scenario are described and given a meaningful name.

The fourth stage Building the Future begins with the participatory definition or selection of the desired scenario or chosen scenario. This is where the path to be drawn to achieve the commitment stage, the relevant action plans. Is the time where the Prospective and Strategy intertwine to form an indivisible pair, as Godet (2000) explains. No doubt, this is the most complex stage, where they reconciled the interests of stakeholders, resolved their disputes, environmental challenges faced, resolved internal challenges. In other words, they must be internalized change factors for the desired scenario. From a systemic point of view is to establish the process towards the development of the system of the present situation to the desired situation in the future.

2.2 Tools for prospective process.

Different disciplines provide methods and tools to complete each stage of the prospective process. For Understanding the context stage will have different qualitative methodologies based on expert consultation, as the panel of experts, focus groups and Delphi method, among others. There are also some tools to graphically represent the object of study as a cause-effect or a tree problem diagrams. Here are also the analysis of megatrends, the systems view, the Marc's Giget Tree and analysis of time series, which, in addition to providing general information about the object of study, also allow you to have a strategic analysis of information for the future.

At the Strategic visualization stage, there are tools specific to classify or weigh the relative weight of the components, factors, actors and/or forces that influence the object of study behavior. As the structural analysis (MICMAC), stakeholder's analysis (MACTOR) and internal and external forces analysis (SWOT).

To develop the third stage Drawing the Futures, are available both methodologies prospective as the forecast. As an example for the design of scenarios, such as Peter Schwartz axes, System Cross-Impact Matrices (SMIC), the Morphological Analysis and Prospective Method of Scenarios and Strategy Network (MEYEP). Within the quantitative methodologies, are the Time Series Analysis, Causal Models and System Dynamics Modeling, which allow the design of scenarios using an exploratory approach.

At the stage of Future constructions, are essential tools and methodologies such as Planning, Strategic Intelligence, Interactive Management, Game Theory and Negotiation and Conflict Resolution, where he established and managed processes for the transformation of this in the desired state in the future.

2.3 Generating knowledge to move from anticipation to action

Anticipation, stakeholder's ownership and action are equally important concepts for building futures. Godet & Durance (2007) define three inseparable areas that give meaning to Strategic Prospective. On the one hand, anticipation, through a forward thinking, which will feature support and content to a vision that established under a collective orientation, achieved the ownership by stakeholders, thus defining the scope of it as a task of the same through the action.

Godet (1993) confirms that "the aim of prospective is precisely determined, what might be the values of the environment parameters taking into account the forces present, projects and actors. What they are, regardless of any formalities, possible, achievable and desirable scenarios. Thus, foresight provides the necessary tools to analyze the problem or study object, recognizing its major elements and providing a specific methodology that suits the objectives. To build sustainable future participation of all stakeholders is necessary. Eleonora Barbieri Masini argues that "participation as a feature of prospective, is related to one based on the values of democracy and citizen participation in decision-making and building their own future vision." (Barbieri, 1993)

. As mentioned throughout the writing, prospective provides tools and methodologies for the scenarios and variables and key stakeholders. It provides an orderly way to wander into the future and imagine what could happen, facilitating the development of specific strategies.

We must take a proactive mentality and the strength and energy to devote to building the most desirable scenario. Instead of being concerned about the aches and pains that could bring the future, it is preferable to allocate attention to the forging of a collective consciousness to change it. This attitude must be supported by concrete actions and strategies to change the course of things; here comes the prospective, not only as a way of thinking, but using an effective methodology.

3 Bats preservation at La Boca Cave

This case study aims the bat specie *Tadarida brasiliensis* (known as free-tailed bat) inhabiting the Boca (mouth) Cave. The cave houses some bat species permanently and others that are migratory. This cave is located in the town of Santiago Nuevo León, within the Protected Natural Area "Sierra Cerro de la Silla" to 36 kilometers from the city of Monterrey. In 2004 the cave was home to a colony of between 600 and 700 thousand

individuals of this specie, having lost in the 90s to 95% of its population (Vela, 2004). Protective actions were limited to the site and therefore the risk of loss of the colony was latent.

The principal objective research is the generation of possible, probable and desirable scenarios to help solve the problems of the Boca Cave, promote the protection and preservation of their bats, as well as the sustainable development of the area. Seeking better and deeper understanding problems of the cave, and make recommendations grounded in strategic prospective aimed at the preservation of the species to a horizon of 10 years.

3.1 Sources of the problem

In general, is detected a lack of environmental education, public disinterest and null respect to biodiversity, specifically related to this bat population, which is subject to constant vandalism inside the cave. The human being has become a major threat to bats and biodiversity in the Boca Cave. In 1991, an investigation of Bat Conservation International documented alarming bats losses in 8 of 10 caves in Mexico that have the largest populations, including the Boca Cave (Walker, 1995). It is estimated that in this place there was a colony with more than 5 million bats easily consumed over 50 tons of insects per night (Moreno, 1996).

Over the years and to date, the cave has been visited by a recurring and varied class of tourists, from those drawn by curiosity to know the bats; maybe other vandalism done by ignorance (as fire, graffiti, firecrackers, garbage), to those who are attracted by the scenic beauty of the place. Whatever be the reason, people have been causing a high impact (some unknowingly and others knowingly) to this fragile ecosystem. Moreover, in front of the cave there is an opencast mine, and there near a treatment plant wastewater is located.

3.2 Methodological process

Prospective is an attitude from a comprehensive and systematic vision to construction of a multiple and uncertain future, with evolutionary structures and dynamic relationships, through actions taken in present (Godet, 2000). For Context understanding stage, the literature review, expert interviews and site visits were made. Global trends in environmental matters, such as sustainable development, biodiversity and ecotourism are

documented. Also, the characteristics of *tadarida brasiliensis*, their ecological and economic benefits, as well as existing legislation at international, national and local levels on the protection of species are investigated.

In Strategic visualization a SWOT analysis that allows to locate the internal and external situation of the problem is made; MICMAC analyzing strategic variables for the preservation species; and MACTOR that identifies the set of stakeholders related to the problem, its main convergences and divergences. In step Drawing the Futures takes a SMIC where probable, possible and desirable scenarios for the Boca Cave are generated. Finally, for the Future construction recommendations arising from the research results are presented.

3.3 The proposed future

The MICMAC results show as key variables: Protecting cave, Ecotourism, Municipal and Institutional projects, Sustainable development, Environmental education, Public disinterest, Stakeholders synergy, Harmful activities, Ecological Municipality, Public budgeting and Financing. The key variables are characterized by highly influential and dependent, ideal for on / off dynamics of the system, or in this case essential to help and preserve the population of bats in the Boca cave.

In MACTOR 12 strategic objectives were raised that were evaluated by 12 actors in the public areas, private, NGOs and scientific community. The objectives were: 1 Define the legal structure of protection and conservation of the cave and its area. 2 Provide the area of equipment, tools and infrastructure needed to protect the area and the cave. 3 Actively participate in the implementation of programs, actions and activities to protect and conserve the area include erosion control, reforestation of green areas, species monitoring, and habitat assessment. 4 periodically develop research and studies on environmental services associated with the bats species. 5 Plan and implement comprehensive environmental education and ecological culture. 6 Having the technology in conservation and preservation of natural areas. 7 Establish a Council of NGOs, Municipality of Santiago, Regional government, private sector and universities, with the purpose of the administration, management and marketing in the area. 8 Establish control measures and effective care of the cave and surrounding area. 9 Disseminate to the public the activities and programs of conservation, research, environmental education, for the benefit of the community. 10 Establish mechanisms for cooperation, cooperation and

active participation among stakeholders. 11 Provide financial resources to carry out programs, projects, actions and activities related to the sustainable development of the area. 12 Develop ecotourism activities in the area of low impact, achieving sustainable economic growth in the region, and the financial sustainability of the project in the future.

For the realization of the possible and desirable scenarios with respect to the issue of the Boca Cave, six hypotheses of future were defined, that together help determine the success or failure of the preservation of the Boca cave. According to SMIC and taking into account the probability of occurrence of each future hypotheses, the 4 most likely scenarios were obtained: Scenario 1 "Bat Survives", Scenario 2 "The fateful", Scenario 3 "and now, who can help us?", and Scenario 4 "I have everything except money", with 41.5%, 22.6%, 14.1% and 4.3% probability of occurrence, respectively.

Scenario 1, "Bat survives", is the most likely and most desirable, where 6 future hypotheses occur. There is a compromise between the stakeholders (H1), extensive environmental education programs are established (H2), an ecotourism project is located in the Boca Cave (H3); a board / trust for the management of the area is established (H4); institutional programs and projects are created in favor of the protection of bats in addition to available financing and public interest (H5), legal land issues are solved, and no harmful activities are recorded in the Boca Cave (H6). Under this scenario, partnerships between stakeholders were successful in that they led to the implementation of programs, strategies and activities for the conservation and bats preservation. The challenge is met and Nuevo Leon is among the first states with comprehensive programs of environmental education and ecological culture. Tourists, farmers and livestock, main divergent stakeholders in the system, they become more aware of the benefits it brings this bats to human health.

4 Future scenarios for wastewater reuse

Water is a finite resource and vital for the preservation of life and the development of the societies; therefore, its conservation is an imminent necessity. Population growth, pollution, climate changes and an inadequate management, among other factors, have contributed to the water scarcity condition. Some countries and regions that actually face serious water stress problems have matured on practice the wastewater reuse. Israel, and Canary and Balearic Island in Spain are examples of that.

Mexico is currently dealing with severe water scarcity; its main industrial and urban centres are located in regions where the natural water availability is limited due to its geographical conditions. Central and northern territories are arid and semiarid regions that concentrate two thirds of the national population and only 30% of the natural water availability. To deal with this situation, it has been necessary the construction of major infrastructure for water supply. As an example, the dam “El Cuchillo” that supplies drinking water to the Metropolitan Area of Monterrey, region in which this work is focused.

4.1 Background case

The Metropolitan Area of Monterrey (MAM) is located in the northeast of Mexico characterized by a semiarid climate, rain scarcity and an important population growth. Even though the metropolis treats 100% of the wastewater generated, only 10% is reused, mainly at industries and golf fields; leaving aside other important potential uses such as landscaping irrigation, agriculture, reuse in homes, businesses, municipalities, and even indirect production of drinking water through the injection of treated wastewater to the aquifers, among others options. If these uses were regarded as feasible options, 100% of the treated wastewater could be reused, diminishing the pressure on water resources and allowing water availability at the MAM for future generations. Another important point to consider are the energy costs required to pump water from other basins and bring them to the cities, so water reuse implies a reduction of volumes pumped and therefore less CO₂ emissions.

Considering the above, the case aims to propose future scenarios for the reuse of treated wastewater in the metropolitan area of Monterrey, identifying the elected scenario in order to release a larger amount of water.

4.2 Methodological process

For Context understanding stage, the literature review, expert interviews and site visits were made. Global trends in Wastewater Treatment, such as the major trends in the treatment of waste water and international cases where measures have been taken to increase this activity are presented. Also, the characteristics MAM wastewater treatment, their technical and policy aspects, current situation of water availability and reuse are investigated. In Strategic visualization by applying a structural analysis of the most

relevant variables are identified. In step Drawing the Futures with the implementation of the SMIC method was developed and describe future scenarios for water reuse in the metropolitan area of Monterrey. Finally, for the Future construction recommendations to achieve the chosen scenario are presented.

4.3 The proposed future

This research helped to figured out a scenario for the wastewater reuse at the MAM Monterrey. With an analysis of the world, national and the local conditions, 24 variables, involved in the studied system, were identified and classified within a subsystem. These variables used with the prospective tool Structural Analysis giving a result of 17 strategic variables: water availability, environmental education, infrastructure, treatment model, water value, technology, reuse, scale treatment, water culture, cost of treatment, treated water competitiveness, consumers, efficiency of collection and reuse system, human capital, industrial wastewater treatment, treated wastewater coverage and financing.

Those variables were used to prepare six hypothetic events. Application of the SMIC method to the events for identification of the four most probable scenarios for wastewater reuse at the MAM: Scenario 1 "Achievement of Water Balance", Scenario 2 "Arrogance has blinded us", Scenario 3 "We are left with good intentions", and Scenario 4 "Voluntarily to try", with 29.1%, 21.7%, 17.6% and 14.7% probability of occurrence, respectively.

Scenario 1, "Achievement of Water Balance", is the most likely and most desirable, where all events happen: Water culture in terms of reuse, environmental programs, acceptance of the use of treated water by the water company (H1). Adopting a decentralized model of treatment of small and medium scale sewage collection system and water distribution and treated with an efficient infrastructure (H2). Adequate treatment of wastewater before discharging to the drain by the industry (H3). Incentives to encourage citizens to recycle water, investment in technology and improvements in effluent quality (H4). Price and quality of treated wastewater compared with drinking water (H5). MAM focused on increasing the reuse of treated water, where the ideas and strategies are routed through concrete actions covering different angles to ensure the availability of water (H6).

Finally, revaluation of water through water rates, severe penalties when permissible limits of pollutants are exceed, re-identification of industries for the type of pollutants

emitted; implementation of dual water supply system for new buildings, including gray water reuse network, decentralized treatment plants built for each housing complex or building under construction; in terms of culture and environmental education, promotion campaign for water reuse and agreement between public and private educational institutions; injection aquifers; and creating agreement with municipalities for the use of treated water, were recommended.

5 Conclusions

This paper highlights the importance of having the knowledge to design sustainable futures by analyzing two case studies. The prospective process applied to the Boca Cave and Water Reuse problems at Monterrey contributed to the reality understanding from a number of important variables, generating knowledge about the influence relationship between them. Moreover, in the case of the Boca Cave analysis of key stakeholders to preserve bats, allowed know the alliances and conflicts among them, taking into account the assessment owed to the strategic objectives, direct and indirect influence on another and each had power to move to action to others.

Also, the solution to both problems with a focus on sustainability was visualized in the future, from design of six future hypotheses for each case study. The assessment of the occurrence probability of these hypotheses by experts yielded possible, probable and desirable scenarios, through a system of cross-impact matrices (SMIC), identifying and describing those four who accumulated 80% probability.

The study aims to be part of the limited references to the on Boca Cave and water reuse in Monterrey currently serving as the basis for future analyzes. It is expected that the results generated in these two cases would aid to know possible future solutions that allow us as human a better coexistence with other species that cohabit the planet and make efficient use of natural resources which we base our development.

Structured Abstract

Purpose – The purpose of this paper is to investigate the context of knowledge management as an important pillar for many business companies to reach sustainable outcomes. Particularly, we explore the field of knowledge management and supply chain management linked to the achievement of sustainable performance. As a sustainable variable, knowledge may positively affect the relationship between supply chain structure and performance.

Design/methodology/approach – Knowledge Management has become increasingly important among researchers because of its importance as a variable of strategic performance. Its implementation within a strategic perspective may drive firms to successful goals. On the other hand, Supply Chain Management has reached a peak as a research topic and researchers have focused their studies on linking it to the concept of sustainability. Knowledge Management may be seen as a factor to ensure sustainability in supply chain because it is considered a fundamental key point for the achievement of social, environmental and financial goals. Starting from a broad literature review, we build a conceptual framework that links the concept of Knowledge Management, Supply Chain Management and Sustainability, and underlines the implementation of knowledge resources within a supply chain structure (i.e. a supply chain strategy oriented to efficient or responsive goals) as a driver to improve performance in sustainable terms. We propose an empirical approach based on a set of 220 worldwide firms operating as retailers and consumer packaged goods companies. By a regression linear model, we explain this positive relationship between knowledge management and social, environmental and economic performance.

Originality/value – This methodology puts in evidence that knowledge resources oriented to the concept of sustainability may address business companies to improve their supply chain operations and performance. Therefore, supply chain companies may structure their strategic orientation to better achieve social, environmental and economic outcomes.

Practical implications – The outcomes of the application explain knowledge management as a supply chain key factor to create a competitive sustainable advantage. In so doing, we aim at guiding supply chains towards social, environmental and economic performance through the integration of Knowledge Management within their strategic decisions.

Keywords – Sustainability, Supply Chain, Knowledge Management, Performance

Paper type – Academic Research Paper

1 Introduction

Supply Chain Management has been a considerable topic among researchers and practitioners for the last few decades. Actually, this new approach, both in academia and practice, comes from an evolutionary business perspective, where companies try to extend their activities through collaboration with other firms, in order to successfully compete in the global market economy (Lambert, 2008; Seuring et al., 2008). A deep market change has brought companies to review their strategies and operations. Janvier-James (2011) claims global competitiveness in physical exchange is now crucial for economic growth and development. Therefore, globalization of international trade, aggressive competition and technological change represent the main reasons that affect business entities (Sharifi et al., 2013). Consequently, these factors are also driving the development of supply chains where different business units work together (Seuring, 2008). As important phenomena, they have brought firms to compete in a world market, no longer individually (Christopher, 2006). In fact, Hwang et al. (2010) underline how competition has changed recently from being between individual companies to increasingly being between supply chains. All stages within a supply chain have become internationally interdependent. Globalization has forced companies to look for more effective ways to coordinate the flow of materials into and out of the company. Therefore, organizations now understand how SCM can be successfully applied (Halldorsson et al., 2008), in order to reach as many customers as possible all over the world.

Nevertheless, globalization, market competition and technology are not the only understandable reasons. In 2009, Stock & Boyer focused on the effects of managing supply chain and they verified companies operating within it as a whole entity could achieve better economic performance. They confirm the goal of SCM is to reach greater profitability by adding value and creating efficiency, thereby increasing customer satisfaction. This latter aspect has been analysed by Mentzer et al., (2001) which claim the importance of coordination driven by customer needs. Because of customers are demanding goods delivered on time and in a good shape, all stages necessitate closer coordination with suppliers and distributors.

This research firstly shows a broad literature review of three main topics: Supply Chain Management, Sustainability and Knowledge Management. All these topics are linked to one another. Then, a theoretical framework is mentioned in order to explain the purpose of this study. A case study based on worldwide consumer service and goods

companies is provided. Based on it, a regression model using a pooled OLS for panel data is then provided.

2 Literature Review

2.1 Supply Chain

A Supply Chain is generally viewed as a set of collaborative firms. According to this common idea, Lambert et al (2005) define a Supply Chain as a network of companies, or independent business units, from original suppliers to end-customers. It is a network because it has to be composed of three different entities at least. Otherwise it would be a partnership. In fact, a supply chain does not only include suppliers and customers, but also manufacturers, transporters, distributors, retailers (Chopra, S. & Meindl, P., 2007). These figures play important roles. Mentzer, J., Witt, W. D., Keebler, J., Min, S., Nix, N., Smith, D. & Zacharia, Z.(2001) classify a supply chain following three degrees of complexity: a “direct supply chain”, comprising a company, a supplier, and a customer, an “extended supply chain”, including suppliers of the immediate supplier and customers of the immediate customer and an “ultimate supply chain”, referring to all the organizations from the ultimate supplier to the ultimate customer. Through different functions such as new product development, marketing, operations, distribution, finance, and customer service, they collaborate to fulfil the customer needs (Chopra, S. & Meindl, P., 2007). Pienaar W. (2009) defines Supply Chain as a process integration involving organizations to transform raw materials into finished goods and to fulfil the end-user through an efficient transportation system. Supply Chains start with resources (raw materials), combine a number of value adding activities across different business stages and terminate with the transfer of goods or services to consumers (Janvier-James, A.M., 2011). Across these business functions, all single members within a supply chain manage an upstream and/or downstream flow of various nature and content. This exchanging flow consists of goods, services, data and information sharing, knowledge, capabilities and finance. In fact, Mentzer, J., Witt, W. D., Keebler, J., Min, S., Nix, N., Smith, D. & Zacharia, Z., (2001) define Supply Chain as a set of three or more entities (e.g. organizations or individuals) directly involved in the supply and distribution flows of goods, services, finances, and information from a source to a destination (customer). As well as Chopra and Meindl (2007) describe a supply chain as a dynamic entity that

involves the constant flow of information, product, and funds between different stages (supplier, manufacturer, wholesaler/distributor, retailer, customer).

A supply chain must be managed to meet customer needs (Fawcett et al., 2007). The customer assumes an important value. It is not only considered as an end user whereby weaving trade relations. He is an active member of the network where he behaves as a connector.

Management of supply chain is a broad and challenging task (Lambert et al., 2005). SCM is not a concept without problems (Burgess et al., 2006; Stock et al. 2009). These problems include the lack of a universally accepted definition of SCM, the existence of several different and competing frameworks for SCM, issues with terminology and the relative lack of empirical evidence supporting the benefits attributed to SCM (Naslund, D. & Williamson, S., 2010). Mentzer, J., Witt, W. D., Keebler, J., Min, S., Nix, N., Smith, D. & Zacharia, Z. (2001) confirm there is confusion to as SCM's meanings, both in academia and practice. A. M. Janvier-James (2011) claims the field of SCM is a comparatively new one, it is lacking on the definition of the terms and, besides, researchers have different perception of the discipline. Stock and Boyer (2009, p.691) declared "it is impossible to develop sound SCM theory until valid constructs and generally accepted definitions of terms are developed". Researchers, practitioners and organizations have been working to find an accepted definition in the last twenty years. Previously, SCM was used as a synonym for inbound and outbound transportation, operations management or purchasing or a combination of them. The field has been developed including the consumer fulfilment. The most significant definitions are mentioned below:

- Harland (1996) terms SCM as the management of a network of business involved in the ultimate provision of product and service packages required by end customers.
- The supply chain encompasses all activities associated with the flow and transformation of goods from raw materials (extraction), through the end user, as well as associated information flows. Material and information flow both up and down the supply chain. (Handfield and Nichols, 1999)
- Kitsolutions (2003) defines Supply Chain management (SCM) as providing the right goods or services, to the right location, in the right quantity, at the right time and at the right cost;

- According to Grant, D., Lambert, D., Stock, J. and Ellram, L. (2006), Supply Chain management refers to corporate business processes integration from end users through suppliers that provides information, goods, and services that add value for customers;

- The Supply Chain management (SCM) is defined by the Supply Chain Forum (SCF) as the integration of key business processes from end user through suppliers that provide goods, services and information that add value for customers;

- The Supply Chain Management Professionals' Council (2009) asserts that Supply Chain management (SCM) includes the designing and management of all activities involved in sourcing and purchasing, transformation, and all logistics management activities. Principally, it also includes coordination and partnership with network partners, which can be suppliers, mediators, third party service providers and customers. Fundamentally, Supply Chain management (SCM) coordinates supply and demand management within and across corporate;

- Chopra and Meindl (2007) define SCM as the control of all operations, resources, information and funds in order to maximize the supply chain surplus, given by the difference between the revenue generated from a customer's order and the costs incurred by the supply chain while satisfying that customer's order.

2.2 Sustainability

The concept of sustainability has been explored for the last decades. It has become a hot topic since the global community have realized the world where we live in is seriously damaged by human activities. The approach to sustainability and its increase in popularity among researchers and practitioners is due to the awareness of making the present world more respectful to the future generations. In 1987, the World Commission on Environment and Development (WCED) defined sustainability as the development that meets the needs of the present without compromising the ability of future generations to meet their needs. This principle, as indicated by WCED has been recognized as the starting point on which all business companies and organizations have to focus on.

Over these decades, researchers and practitioners have been approaching to the concept of sustainability giving their own interpretations. Starik and Rands (1995), for example, define sustainability as the ability of one or more entities, either individually or collectively, to exist and flourish for lengthy timeframes, in such a manner that the

existence and flourishing of other collectivities of entities is permitted at related levels and in related systems. They focus on the ability of a person, a group or an organization to work to improve their activities in a long term, without losing sight of the next generation. Konrad (1995) follows the same perspective, pointing out that the present and future people have the same right to find, on the average equal opportunities for realizing their concepts of a good human life.

The term of sustainability has been linked to the numerous facets of economics and management. At the base there are factors that have influenced companies to approach to the principle of sustainability. Firstly, it is explained in response to pressures from various external groups such as customers, regulatory bodies, non-governmental organizations, and even their own employees (Linton, J.D., Klassen, R. & Jayaraman, V., 2007; Carter & Rogers, 2008; Teuteberg, 2010; Gupta & Palsule-Desai, 2011; Rehman & Shrivastava, 2011; Aboelmaged, 2012; Kumar, Teichman & Timpernagel, 2012). Stakeholders are increasingly demanding that organizations address and manage the sustainable issues that are impacted by their operations (Carter, C.R. & Easton, P.L., 2011; Kumar, Teichman & Timpernagel, 2012). Secondly, legislation has changed worldwide over the last decades, becoming stricter to issues of environmental protection (Theyel, 2001; Zhu, Q. & Sarkis, J., 2004; Kumar, Teichman & Timpernagel, 2012). Consequently, countries have adopted new rules governing human and business activities (Linton, J.D., Klassen, R. & Jayaraman, V., 2007). Thirdly, companies and organizations recognize the global warming as a societal issue and they are aware that the change must start from their work (Srivastava, 2007; Linton, J.D., Klassen, R. & Jayaraman, V., 2007).

Maintaining the WCED definition, Shrivastava (1995) defines sustainability as the potential for reducing long term risks associated with resource depletion, fluctuations in energy costs, product liabilities, and pollution and waste management. The author notes five key elements that may drive business companies to become more sustainable such as resources, energy, product, pollution and waste. The interpretation of Shrivastava is connected to the environmental sphere. Sustainable development is often reduced to environmental improvements (Carter, C.R. & Rogers, D.S., 2008; Seuring, S. & Müller, M., 2008). Literature has similarly often considered sustainability from this ecological perspective without explicit incorporation of the social aspects of sustainability (Sarkis, 2001; Hill, 2001; Daily and Huang, 2001). Carter & Rogers (2008) claim the definitions of sustainability in the engineering literature have been more encompassing, and have

explicitly incorporated the social, environmental, and economic dimensions of the macro-viewpoint by defining organizational sustainability as, “a wise balance among economic development, environmental stewardship, and social equity,” (Sikdar, 2003) and as including “... equal weightings for economic stability, ecological compatibility and social equilibrium,” (Gonczi et al., 2007).

Sustainability is also considered as a driver for profitability. Kumar, Teichman & Timpernagel (2012) believe that making sustainability a priority in managerial decisions is more than dealing with risk and uncertainty. Companies have to view sustainability as an integral part of decision-making, rather than a constraint (Gupta et al., 2011). It drives companies to save costs, increase efficiency and gain new customers and suppliers. Besides, it incorporates the potential to achieve a competitive advantage and to make profits (Porter & Van der Linde 1995; Seuring, S. et al., 2008; Kumar, Teichman & Timpernagel, 2012).

Sustainability has been referred to the topic of Supply Chain Management. The attention is moved from local optimization of environmental factors to consideration of the entire supply chain during the production, consumption, customer service and post-disposal disposition of products (Linton, Klassen, & Jayaraman, 2007). In particular, many researchers and practitioners have focused on environmental problems arising from business operations. Greening the supply chain has emerged as an important issue in the process of industrial development (Srivastava, 2007; Minhaj, Rehman & Shrivastava, 2011). Gupta & Palsule-Desai (2011) believe supply chains must pay attention to environmental impact across the entire value chain, including those of suppliers, distributors, partners and customers: “Firms’ view of sustainability must transcend a narrow functional perspective and encompass a broader view that integrates issues, problems and solutions across functional boundaries”.

As mentioned in the previous paragraph, most studies have considered sustainability from the ecological point of view. Therefore, focusing on the environmental factor, many researchers have linked the word “green” to the topic of supply chain management, defining it as Green Supply Chain Management (GSCM) (Hassini, 2012).

In a recent literature review, Zhu & Sarkis (2004) explore the concept of Green Supply Chain Management, gathering definitions that consider

- the purchasing function’s involvement in activities that include reduction, recycling, reuse and the substitution of materials (Narasimhan and Carter, 1998);

- the environmental effects of the researching developing, manufacturing, storing, transporting, and using a product, as well as disposing of the product waste_(Messelbeck and Whaley, 1999);

- the practice of monitoring and improving environmental performance (Godfrey, 1998)

- innovations in the context of the environment (Green et al., 1996).

GSCM can be seen as the sum of green purchasing, manufacturing/materials management, distribution/marketing and reverse logistics when addressing all these functions into a more environmental and thus sustainable 'green' context, (Hervani et al. 2005; Kumar, Teichman & Timpornagel, 2012). According to this, Srivastava (2007) defines GSCM as the integration of environmental thinking into supply chain management, including product design, material sourcing and selection, manufacturing processes, delivery of the final product to the consumers as well as end-of-life management of the product after its useful life.

However, considering supply chain management from an ecological perspective may be limiting (Carter & Rogers, 2008; Seuring & Müller, 2008). It is necessary to consider society and economic performance as factors that influence the achievement of sustainability. In fact, the concept of sustainability, as depicted by Elkington (1998) in his triple bottom line figure, must refer to an integration of social, environmental, and economic responsibilities . As GSCM, researchers and practitioners use Sustainable Supply Chain Management (SSCM) as a comparable definition but, this time, it incorporates a deeper perspective of sustainability, consisting of the intersection of those three aspects previously mentioned. Therefore, a supply chain is considered sustainable when all its activities and operations find a right balance between environmental, social and economic factors (Carter & Rogers, 2008; Seuring et al., 2008 (a) Seuring & Müller, 2008 (b); Carter, C.R. & Easton, P.L., 2011; Rogers, 2011; Gupta et al., 2011; Blackhurst et al., 2012).

Carter and Rogers (2008) integrate the triple bottom line with four supporting facets such as

- Strategy: it incorporates actions and initiatives aimed at achieving sustainability within the supply chain;

- Risk management: a plan to identify social, environmental and economic risks along the supply chain;

• Transparency: the information movement up and down the supply chain may increase the coordination of all supply chain operations, improve the relationship among each member and drive the whole supply chain to better performance without wrongdoings;

• Organizational culture: a sharing system of social, environmental and economic values built within a supply chain may stimulate people to work better and to achieve important goals.

Following Elkington's triple bottom line, Carter & Rogers (2008) define SSCM as the strategic, transparent integration and achievement of an organization's social, environmental, and economic goals in the systemic coordination of key interorganizational business processes for improving the long-term economic performance of the individual company and its supply chains. The adoption of sustainable responsibilities can drive supply chain to achieve better economic outcomes in short and long term. Firms which attempt to simultaneously maximize performance of all three dimensions of the triple bottom line will outperform organizations that attempt to only maximize economic performance, or companies that attempt to achieve high levels of social and environmental performance without explicit consideration of economic performance (Carter and Rogers, 2008).

Making a supply chain green and sustainable can save resources, eliminate waste and improve productivity (Porter and Van Der Linde 1995; Srivastava, 2007; Kumar, S., Teichman, S. & Timpernagel, T., 2012). In fact, the adoption of the triple bottom line drives firms to cost savings from packaging reduction, green design, reuse and recycling; health and safety goals due to green transportation, clean warehousing, working improvements; labor cost reduction as the effect of the increase in employment motivation and productivity; operating cost decrease, lead times shortness, and product quality improvement associated with the implementation of ISO 14000 standards; and corporate image growth as the result of ethical business purposes recognized by suppliers and customers (Carter & Rogers, 2008; Carter & Easton, 2011; Kumar, S., Teichman, S. & Timpernagel, T., 2012). What's more, it can potentially increase efficiency and flexibility (Wilkerson 2005). Furthermore, firms that adopt the triple bottom line may develop new sustainable goods and services cooperating with their supply chain partners and involve their stakeholders in making supply chain decisions (Kummer et al. 2006). According to this, Seuring, S. et al. (2008) give their SSCM definition, highlighting the

importance of relations with supply chain partners: cooperation along the supply chain is a key element in fulfilling environmental and social criteria as well as meeting customer needs is determinant to maintain competitiveness and economic performance.

Another SSCM definition, provided by Hassini, Surti & Searcy (2012), takes profitability into consideration. They define sustainable supply chain management as the management of supply chain operations, resources, information, and funds in order to maximize the supply chain profitability while at the same time minimizing the environmental impacts and maximizing the social well-being. Milton Friedman said that the primary social responsibility of business is to increase its profits (Rogers, 2011).

2.3 Knowledge Management

Knowledge has long been viewed as a vital intangible tool for the development of firms. It is a key element to understand firms' behaviour (Eisenhardt and Martin, 2000; Grandori and Kogut, 2002). Knowledge management (KM) guides business companies to better develop skills and capabilities and achieve a competitive advantage (Robinson et al., 2006). Drucker (1999) claims the main purpose of KM is to manage the amount of firm's competencies and skills and align it to business objectives and targets: it is a crucial driver to create value and it is defined as a process of creating, acquiring, capturing, sharing and using knowledge to enhance learning and performance in organizations (Scarbrough et al., 1999; Davenport & Prusak, 2000). Over the last decades, with the increase of studies in SCM, Knowledge Management has been juxtaposing with it. After all, only supply chains compete nowadays, not single companies (Christopher et al., 2006). Researchers and practitioners have explored both topics assessing the possible common links. Knowledge Management is a strategic supply chain tool. Its implementation may bring benefit across each stage of a chain (Hansen et al., 2002). The common sharing of skills and capabilities among each supply chain member may support a better use of business resource, increase productivity and decrease disruptions. A supply chain based on a shared system of values and competencies can only improve cooperation and bring motivation to each unit. In a study case conducted by Dyer and Nobeoka (2000), it is demonstrated that Toyota, allowing its employees to participate and share knowledge within the whole supply chain, achieves motivation and cooperation, and limits opportunism.

In his work, Robinson et al. (2006) demonstrates sustainability is strictly linked to knowledge management. Achieving sustainability in a supply chain requires a good KM strategy (Peterson, 2009). He provides a framework named “STEPS Maturity roadmap” in which defines all stages and activities to perform KM and enhance sustainable goals.

Despite the idea that KM can drive firms to successful performance (Hult et al., 2007; Fugate et al., 2009; Blackhurst et al., 2012), sharing knowledge, either in a business entity or in a supply chain (where more business entities are involved), is difficult. The main barrier is organisational culture considered as one of the most crucial factors (Robinson et al., 2006). Coordinating people and/or units with different cultural background require efforts.

More academic contributions from researchers and practitioners are necessary to assess the impact of KM on SCM. Particularly, further research is needed to explore the alignment of KM strategies with SC performance (Corso et al., 2010; Marra et al., 2012) and the concept of sustainability (Robinson et al., 2006).

2.4 Theoretical Framework

Starting from what is missing, this paper explores the topics of KM and SC within the principles of Sustainability. It provides a theoretical framework (Figure 1) in which it is highlighted how a sustainable knowledge management, in moderating a supply chain strategy, asset and inventory, can achieve successful performance in terms of revenues and costs.

Having a strong knowledge management within a supply chain strategy and business operations is a successful pattern. Generally speaking, a supply chain may improve if it shares all information and knowledge within each stage. This framework shows that a KM oriented to sustainability, if implemented within a supply chain strategy, either responsive or efficient, and a supply chain Asset and Inventory Management, may drive firms to successful outcomes in terms of revenue and costs.

Inventory is what is being passed along a supply chain (Chopra & Meindl, 2007), Asset is what is being used along a supply chain production system and Supply Chain Strategy is how is being planned. These supply chain elements are strictly connected one to another.

A Supply Chain Strategy is critical in making decisions for growth and developing SC should be approached with regards to the firm’s market strategies and priorities

(Christopher et al., 2006; Sharifi, 2013). It should be tailored to match the required “order winning criteria” in the market place (Ambe, 2010; Sharifi, 2013). These “order winning criteria” represent the key point to be better than competitors in a marketplace. Nowadays, facing competition does not mean being as good as competitors anymore. A supply chain has to achieve distinctive competencies, which are recognized as winning skills by customers and competitors. The fundamental changes in the environment require companies to develop supply chain strategies that are aligned to appropriate value propositions and customer markets (Ambe, 2010). Today, making a supply chain green and sustainable can save resources, eliminate waste and improve productivity and performance (Porter and Van Der Linde 1995a, 1995b; Srivastava, 2007; Kumar, S., Teichman, S. & Timpernagel, T., 2012). Furthermore, sustainability is recognized among customers as a synonym of success. Combining sustainability with a good SC strategy is worthy. In order to enhance this combination, all business units within a supply chain may share information oriented to sustainability. Therefore, training supplier with principles of sustainability, sharing a green and technology know-how among stakeholders and collaborating with environmental partners represent the pillar on which to base such combination.

Asset Management refers to a process of monitoring of tangible and intangible goods to a business unit or group. Managing assets effectively may achieve better return in terms of operating performance. It is strongly related to the facility system because it includes the monitoring of plant and equipment.

Inventory Management is the process of monitoring inputs, stored or used in a production system and outputs, stored and sold to customers. Inventory impacts all activities along a supply chain. A good Inventory Management may improve supply chain performance and avoid disruptions and risks. In doing this, a perfect knowledge management is necessary; and if KM is oriented to sustainability, the occurring outcomes are socially, economically and environmentally sustainable.

A Sustainable Knowledge Management is meant as the process by which sustainable information are shared within each business unit or entity. Sustainable information are about making a firm aware of disseminating a culture oriented to achieve social, economic and environmental goals. A sustainable KM, as a moderating effect of supply chain components driven to successful outcomes, should include:

- Supplier ESG Training: it represents a company provision in training on environmental, social or governance factors for its suppliers;
- Environmental Partnerships: it reports on partnerships or initiatives with specialized NGOs, industry organizations, governmental or non-governmental organizations that focus on improving environmental issues
- Technology Know-How Sharing: it measures a company voluntary sharing of licenses, patents, intellectual property or useful technology within a supply chain

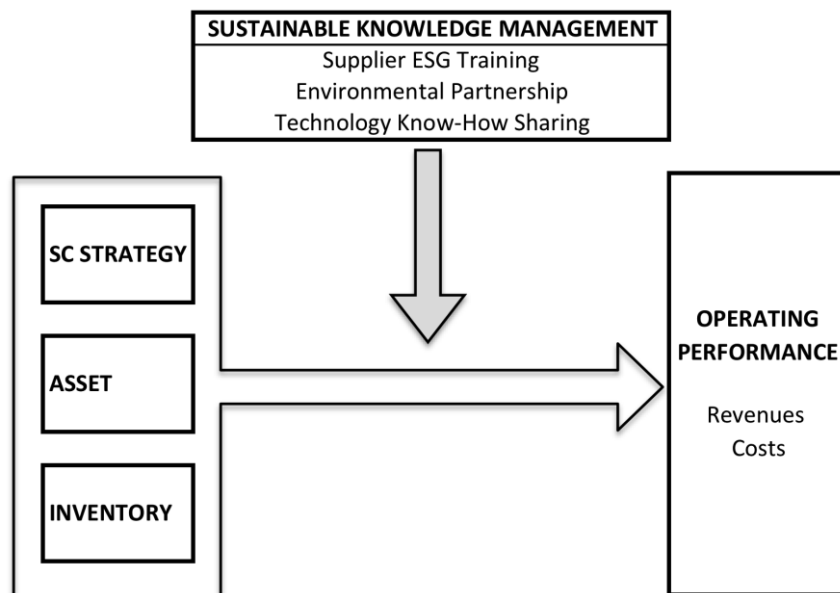

Figure 1 Theoretical Framework

3 Methodology

3.1 Research Objectives

This research attempts to assess how KM oriented to sustainability may effectively moderated on the relation between Asset Management, Inventory Management, Supply chain Strategy and Operating Outcomes (i.e. revenues and costs). Before evaluating these

hypothesis, this analysis firstly assesses how Asset Turnover Ratio, Days of Inventory Ratio and Supply Chain Strategy may relate to revenues and costs in a supply chain and, consequently, if they improve operating performance. This section discuss the data collection and the statistical testing of the following hypothesis:

H1: Asset Turnover Ratio improves operating performance

H2: Days of Inventory Ratio improves operating Performance

H3: Supply Chain Strategy (oriented to efficiency or responsiveness) improves operating performance

H4: Sustainable Knowledge Performance as moderating effects of Supply Chain Strategy improves operating outcomes

H5: Sustainable Knowledge Performance as moderating effects of Inventory Management improves operating outcomes

H6: Sustainable Knowledge Performance as moderating effects of Asset Management improves operating outcomes

3.2 Research Methodology

This paper is based on a study of global business companies operating in different sectors such as beverages, food and drug retailers, food producers, general retailers, household goods and home construction, leisure goods, personal goods and tobacco (ICB source). All these sectors belong to main industry categories, Consumer Goods and Consumer Services. In order to make this research easier, it is only considered the ICB industry classification as a dummy variable named “dINDUSTRY”; therefore, the ICB indicator classified by sectors is excluded. Using as a criterion Forbes List 2013 of Global 2000 Biggest Public Companies screened in four metrics (i.e. sales, profit, assets and market value), the sample frame has been restricted to 215 firms. The data for company performance were extracted from Thompson Reuters Datastream Software over a period of ten years, from 2003 to 2012: specifically, Asset 4 ESG Data for social, environmental and economic data points and Worldscope for financial indicators. The sample frame comprises 2150 discrete datasets. Social, environmental and economic data points collected from Asset 4 ESG Database do not cover all analysed period of time, due to the recent global companies’ awareness in performing sustainability reports. Therefore, the panel data results unbalanced. In order to simplify data analysis and minimize errors, we calculated a standard score for Supplier ESG Training, Environmental Partnerships and

Technology Know-How Sharing Performance basing on the mean of the sample. Supply Chain Strategy (SC Strategy) binary variables have been built considering three financial indicators such as Ebitda Margin, Asset Turnover and Inventory Turnover and their deviation from their own mean value. Each financial indicator has been calculated for each company included in the sample frame, extracting data from Worldscope over a period of ten years (from 2003 to 2012); subsequently, a mean value for each indicator has been provided, considering the industry classification factor. A value of 1 has been assigned to companies that had a more efficient strategic orientation. Specifically, a value of 1 has been given when:

- $Ebitda\ Margin_{nt} \geq \mu_{Ebitda\ Margin}$ $n = Company, t = Year$
- $Asset\ Turnover_{nt} \geq \mu_{Asset\ Turnover}$ $n = Company, t = Year$
- $Inventory\ Turnover_{nt} \geq \mu_{Inventory\ Turnover}$ $n = Company, t = Year$

All variables have been transformed in logarithm in order to minimize the range of data (except for Supply Chain Strategy Indicator, either efficient and responsive, and dummy industry).

3.3 Statistical Method

In order to test our hypothesis, we conducted the analysis using a pooled OLS regression for linear panel data on Stata Statistical Software. This model generates a Driscoll & Kraay standard error that is robust to general forms of cross-sectional and temporal dependence when the time dimension is large (De Hoyos & Sarafidis, 2006). This approach eliminates the inaccuracies arising from the use of the Parks-Kmenta and Becks-Kats methods, which are unsuitable for microeconomic panel with a large cross-sectional dimension N. This statistical method works for panel data both balanced and unbalanced. Pooled OLS regression was performed in order to describe a link between economic outcomes and financial and operational indicators, moderated by sustainable knowledge variables.

3.4 Regression Analysis And Results

The regression analysis assesses two different dependent variables: firstly, net sales and revenues and, secondly, cost of good sold. As independent variables, this study includes some financial ratios (i.e. Asset Turnover and Days of Inventory), a supply chain

strategy indicator (i.e. a measurement of Efficient and Responsive Supply Chain) and some sustainable metrics related to training, partnerships and information technology (i.e. Supplier ESG Training, Environmental Partnerships and Technology Know-How Sharing). All these data have been combined in order to evaluate the hypothesis. For all models, Market Value and Financial Leverage are mentioned as regressands, as well as a dummy variable related to industry classification.

Table 1 shows a Pooled OLS regression with a Driscoll and Kraay standard error using Net Sales variable as a regressor. For each independent variable, four regression models are provided in four columns. This study separately analyses the regression models of Asset Turnover Ratio, Days of Inventory and Supply Chain Strategy oriented to efficiency or responsiveness. Financial Leverage and Market value are mentioned as control variables, as well as a dummy variables classified by industry are mentioned per each model.

NET SALES= Net Sales; CONST=constant; ASST=Asset Turnover; DOI=Days of Inventory; SCEFF=Supply chain Efficiency; SCRESP=Supply Chain Responsiveness; FINLEV=Fonancial Leverage; MKTVAL=Market Value; dINDUSTRY=dummy Industry.

Table 1 Regression Table

All four models are statistically significant ($p<0.001$) and high reliable (R-square between 0.88 and 0.89). All four independent variables affect net sales ($p<0.001$), as well as Financial Leverage and Market Value ($p<0.001$). Particularly, on one hand there is a positive relation between the dependent variable and Asset Turnover and Supply Chain

Responsiveness; on the other hand there is a negative relation between Net Sales and Days of Inventory and Supply Chain Efficiency. The dummy variable (dINDUSTRY) is significant for all models and negatively affect the variable Net Sales; referring only to the first regression model, the dummy variable is weakly significant.

Table 2 is as structured as Table 1. It shows a Pooled OLS regression with a Driscoll and Kraay standard error using Cost of Goods Sold (COGS) as a dependent variable, instead of Net Sales. For each independent variable, four regression models are provided in four columns. The regression models of Asset Turnover Ratio, Days of Inventory and Supply Chain Strategy oriented to efficiency or responsiveness are separately evaluated. Financial Leverage and Market value are mentioned as control variables, as well as a dummy variables classified by industry are mentioned per each model.

Table 2 Regression Table

All four models are statistically significant ($p < 0.001$) and high reliable (R-square between 0.81 and 0.85). All four independent variables affect COGS ($p < 0.001$), as well as Financial Leverage and Market Value ($p < 0.001$). Particularly, on one hand there is a positive relation between the dependent variable and Asset Turnover and Supply Chain Responsiveness; on the other hand there is a negative relation between Cost of Goods

Sold and Days of Inventory and Supply Chain Efficiency. The dummy variable (dINDUSTRY) is strongly significant for all models and affect negatively the dependent variable.

Table 3 shows a Driscoll and Kraay standard error regression method with two dependent variables (i.e. Net sales and Cost of Goods sold) and a main independent variable (Asset Turnover). Three models are provided for each regressor. These display the interactions between Asset Turnover Ratio and three different metrics related to sustainable knowledge performance (Supplier ESG Training, Environmental Partnerships and Technology Know-how Sharing). Each model includes two financial indicators (Market Value, Financial Leverage) as control variables, and a dummy variable based on ICB Industry classification.

NET SALES=Net Sales; COGS=Cost of Goods Sold; CONST=constant; ASST=Asset Turnover; SESGT=Supplier ESG Training; EP=Environmental Partnerships; TKHS=Technology Know-How Sharing; ASST#SESGT=interaction between ASST and SEGT; ASST#EP=interaction between ASST and EP; ASST#TKHS=interaction between ASST and TKHS; FINLEV=Financial Leverage; MKTVAL=Market Value; dINDUSTRY=dummy Industry.

Table 3 Regression Table

Referring to Net Sales as regressor, all three models are statistically significant (p-value<0.001) and reliable (R-square 0,89). Four companies have been cancelled due to the lack of data. Each interaction strongly affects business revenues (p-value<0.001), as well as Financial Leverage and Market Value. All other variables are statistically important, except for Supplier ESG Training (SESGT) in the first model. All interaction positively affect Net sales, except in the third model, where an increase of ASST#TKHS determines an increment of the dependent variable. Implementing Technology Know-How Sharing within a supply chain asset management seems not to be helpful in

improving economic performance. Similarly, where the dependent variable is Cost of Goods Sold, all three models show high significance (p-value<0.001) and reliability (R-square 0,84 approximately). Four companies have been cancelled due to the lack of data. The interaction effects are statistically important in affecting costs (p-value<0.001). The same consideration in terms of interactions' results may be also applied for this case. All moderations positively affect COGS, except for ASST#TKHS where the relation is negative; however, the latter result is not pessimistic: in fact, its increase determines a decrease in COGS that is very good in terms of operating outcomes. And, comparing the effect of this interaction with Net Sales firstly and COGS then, the emerging negative relation is not unfavourable. Financial Leverage and Market Value are also significant variables (p-value<0.001) and positively affect the dependent variables. The dummy variable has a negative relation, instead.

Table 4 displays the same regression using the same dependent variables (Net Sales and Cost of Goods Sold). It diverges from Table 3 because a different independent variable (Days of Inventory Ratio) is mentioned. The structure is similar: it covers the interaction between Days of Inventory ratio with three sustainable knowledge metrics previously mentioned, through three models per each regressor. As control variables, Financial Leverage and Market Value have been incorporated. The analysis includes a dummy variable related to industry.

Table 4 Regression Table

Where Net Sales is a regressor, all three models are strongly significant (p-value<0.001) and reliable (R-square equals to 0,89). Six companies have been cancelled from the regression, due to the lack of sustainable knowledge management data. The variable Days of Inventory is statistically important (p<0.001) and negatively affect the dependent variable. Focusing on all interactions of each model, only the interaction between Days of Inventory and Supplier ESG Training has a weak significance (p<0,05) and negatively affects the relation. Financial Leverage, Market Value and Dummy Industry are statistically effective (p-value<0.001).

Similarly, where the dependent variable is Cost of Goods Sold, all three models show high significance (p-value<0.001) and reliability (R-square around 0,85). Stata software eliminated six companies from the sample frame, due to the lack of data. The variable Days of Inventory is statistically important (p<0.001). Equally to the previous analysis, the interaction between Days of Inventory (DOI) and Supplier ESG Training (SESGT) is the only one to be statistically significant and affects COGS in a negative way. This result explains how Inventory management if moderated by Suppliers' training in sustainability, improves a supply chain operating performance. An eventual increase of this interaction induces a decrease in costs more than a reduction in revenues. Financial Leverage, Market Value and Dummy Industry are strongly important in each model (p<0.001).

Table 5 follows the same structure of Tables 3 and 4. Supply Chain Efficiency is here analysed. Three moderating effects are provided, using the indicator of Supply Chain Strategy with three sustainable KM metrics. Furthermore, the analysis includes the same control variables and a dummy variable of Tables 3 and 4.

Table 5 Regression Table

Regarding to Net Sales as dependent variable, all three models are strongly significant (p-value<0.001) and reliable (R-square 0,87 approximately). Four companies have been deleted from the regression analysis, due to the lack of data. The interaction between Supply Chain Efficiency and Technology Know-How Sharing (SCEFF#TKHS) and Supplier ESG Training (SCEFF#SESGT) are lightly significant (p<0.1) and positively affect the dependent variable . SCEFF affects the relation in all the models (p<0.001), as well as Financial Leverage, Market Value and dummy Industry. Similarly, where the dependent variable is Cost of Goods Sold, all three models show high significance (p-value<0.001) and reliability (R-square 0,80). The same four companies have been cancelled from the pooled OLS regression, due to the same reason explained previously. The same interactions positively affect the relation, except for the second model where SCEFF#EP is not significant. All control variables are determinant (p<0.001); Financial Leverage and Market Value have a positive relation, while the dummy variable negative affect the dependent variables.

In table 6, the regression focuses on the other side of a supply chain strategy, that is when it is oriented to responsiveness. The selected variables are similar: Net Sales and COGS as dependent variables and SCEFF and its interaction with three sustainable KM metrics as independent variables and Financial Leverage, Market Value and Dummy Industry as control variables.

Table 6 Regression Table

All regression models with the regressors Net Sales and COGS are statistically significant ($p < 0.001$) and reliable (R-square 0,87 and 0,80 approximately). Four companies have been cancelled from all regressions, due to the lack of data. The interactions between Supply Chain Responsiveness and Environmental Partnerships are not statistically significant, either where the dependent variable is Net Sales or where it is COGS. All other interactions are significant and positively related to the dependent variables. Financial Leverage, Market Value are strongly important ($p < 0.001$) and directly affect the relation, instead of dummy industry, which is determinant ($p < 0.001$) but negatively correlated.

4 Conclusions, Limitations And Future Research

This research shows how supply chain strategy, asset and inventory management are important to achieve successful goals. All these components of a supply chain are strongly related to revenues and costs. Their increases or decreases affect the relation with the dependent variables. Referring to Asset Turnover, its coefficient positively affects both relations, either when the regressor is Net Sales or when it is COGS. Its increase determines an equal increment of both dependent variables. Therefore, as Asset Turnover increases, revenues and costs raise at the same level. Referring to Days of Inventory, the regression model displays a negative effect: when DOI increases, both regressors decrease. However COGS grows more than revenues. Companies may control their Inventory Management trying to store all stock materials as less days as possible. Considering a supply chain strategy, consumer service and goods companies, if they are oriented to efficiency, can decrease operating costs more than net sales; on the other hand, firms oriented to be responsive raise their costs more than their revenues. This analysis proves previous studies conducted by several researchers in the past (Fisher, 1997; Lee, 2002; Chopra & Meindl, 2007; Christopher, 2007).

When these indicators are moderated by three different metrics that define a KM oriented to sustainability, operating performance improve in a better. Despite the fact some interactions do not have a statistical significance, it is important to claim that training suppliers to sustainability principles, collaborating with environmental partners and sharing a technology Know-How, if implemented within strategy, asset and inventory management, let a supply chain grow sustainably. Specifically, this positive result can be

viewed when all sustainable KM metrics moderate Asset Turnover and Supply Chain Strategy oriented to Responsiveness. When moderated by Supplier ESG Training, Days of Inventory indicator reveals a different trend. Its increase determines a higher decrease in terms of costs. Therefore, consumer service and goods companies may control their stock expenditures if they train their supplier to be sustainable.

The limitation to this paper is that needs to better define a supply chain strategy. Supply Chain Strategy has been calculated from Worldscope Datastream, using financial data. Interviews are needed in order to collect such qualitative data that better define an adopted strategy. A supply Chain Strategy is also based on indicators related to time and order (i.e. order fulfilment lead time, order cycle time, order flexibility, time delivery, customer response time). These additional data help to distinguish a strategy oriented to efficiency from a strategy oriented to responsiveness.

The next stage of this research is to analyse how a sustainable KM metrics may affect transportation and delivery. Transportation is a crucial driver that strongly impact on supply chain performance.

Structured Abstract

Purpose – Recent years have been characterized by a growing interest toward sustainability issues. In fact, themes such as a more efficient use of the energy resources have taken a central role in the debate on energy policies of developed countries. In particular, it has been demonstrated that energy efficiency in residential buildings is one of the keys to reducing overall energy consumption and greenhouse emissions. In this work, we propose an innovative system for monitoring and managing energy consumption in “Smart Home Environments” (SHEs), according to the needs of users and to the particular state conditions of the considered environment.

Design/methodology/approach – The paper focuses on a methodological approach to design a SHE based on the following steps:

- Identify and apply technological solutions to provide additional intelligence and connectivity services to existing heterogeneous home devices.
- Define an architecture of SHE, supported by a centralized management system featuring a smart Central Control Unit (CCU) and different peripheral devices of sensing and actuating.
- Define a data management model in order to handle machine-to-machine and machine-to-human interactions.
- Define a set of decision algorithms and interoperability rules to perform energy-control services, basing on quantitative forecasting methodologies for analysis of historical data.

Originality/value – Different approaches to the design of SHEs are emerging in literature, emphasizing the importance of such a type of applications as a mean to guarantee energy and cost saving. However, most of these approaches are essentially focused on the technological issues, relying primarily on the architectural characteristics of the Home Energy Management Systems (HEMS). In this work, we intend to highlight

how a knowledge-based management model can support the design of innovative HEMSs, providing the energy performance improvements of the considered environment and the adaptability to the user's habits and needs.

Practical implications – In line with the goals of Europe 2020 strategy, energy resource saving represent a key issue for sustainable development. Among the various technological solutions for reducing energy consumption in home environments, the so called “Building Automation and Control Systems” (BACS) represent high performance and low impact solutions for energy efficiency. In this context, the proposed system, whose development is ongoing, offers in prospect the opportunity to improve the energy performance and electricity cost saving of residential buildings, featuring at the same time a low architectural impact due to the use of wireless and/or powerline technologies.

Keywords – Smart Home Environment, Sustainability, Energy Efficiency, Home Energy Management System.

Paper type – Academic Research Paper

1 Introduction

Over recent years, interest in aspects related to sustainability and energy saving has been growing dramatically. In fact, the rising energy demand and the growing evidence for the climate change have created an increased need for energy-efficient and energy-saving solutions around the world. Particularly interesting is the context of energy consumption in the buildings sector: nowadays, commercial and residential buildings account for nearly 40% of yearly worldwide energy consumption and are responsible for a similar level of global CO₂ emissions. In particular, houses are becoming one of the major contributors to the countries energy balances: as a matter of fact, it is expected in the near future that the home energy consumption will probably exceed 40% of the total yearly consumption in most of the developed countries (D&R International, 2012). Therefore, energy efficiency in residential buildings is one of the keys to reducing overall energy consumption and greenhouse emissions.

A large number of concepts and solutions can be adopted in order to optimize the energy efficiency in buildings. These include improving the building envelope thermal characteristics, replacing existing heating equipment and household appliances, lighting with higher efficiency devices, and switching to less carbon-intensive fuels for space and domestic hot water heating (Aydinalp et al., 2002). Among the various approaches, Home Energy Management Systems (HEMSs) offer a proven and interesting alternative

to reduce energy consumption in home environments through the monitoring and the managing in real time of most of the home appliances (Niyato, 2012). Moreover, recent developments in ICT offer home devices featuring local intelligence and connectivity services, making such devices “smart objects”, i.e. able to acquire, manage and apply knowledge about an environment, to interact with other smart objects and to adapt their behaviour according to the needs of the home inhabitants (Elmenreich and Egarter, 2012).

Therefore, basing on the paradigm of the Internet of Things (IOT) (Atzori, 2010), it is possible to introduce the concept of “Smart Home Environment” (SHE) as a place where multimedia services are provided to users, while heterogeneous smart appliances are interconnected and interact allowing to save energy, to reduce costs and, at the same time, to improve comfort and safety.

In the scientific literature, different approaches to the design of SHEs are emerging, emphasizing the importance of such a type of applications as a mean to guarantee energy and cost saving. However, most of these approaches are essentially focused on the technological issues, relying primarily on the architectural characteristics of the HEMS (Son et al., 2010; Viani et al., 2013; Han and Lim, 2010).

In this work, we propose an innovative system for monitoring and managing energy consumption in SHEs, according to the needs of users and to the particular state conditions of the considered environment. In particular, we intend to highlight how a knowledge-based management model can support the design and the development of innovative HEMSs, ensuring the energy performance improvements of the considered environment and the adaptability to the user’s habits.

2 Methodological approach for the design of SHEs

The concept of Smart Environment evolves from the definition of Ubiquitous computing that promotes the ideas of “*a physical world that is richly and invisibly interwoven with sensors, actuators, displays, and computational elements, embedded seamlessly in the everyday objects of our lives, and connected through a continuous network*” (Weiser et al., 1999). Therefore, a Smart Home (see Fig.1) can be generally referred to a fully equipped environment, featuring interconnected smart devices and a management software which evaluates the gathered information and makes decisions with the aim of ensuring energy and cost saving, as well as improving comfort and safety.

Fig. 1. Typical architecture of a Smart Home

According to these guidelines, the methodological approach adopted for the design of the proposed system is based on the following steps:

- Identification and implementation of technological solutions which provide additional intelligence and connectivity services to existing heterogeneous home devices in order to guarantee their interconnection and interoperability (Perumal et al., 2008).
- Definition of the SHE architecture, based on the use of a centralized management system featuring a central control unit (CCU) and different peripheral devices of sensing and actuating.
- Definition of a data management model for the software of the CCU in order to handle machine-to-machine and machine-to-human interactions (Moreno et al., 2014; Sayuti et al., 2014).
- Define a set of decision algorithms and interoperability rules to perform energy-control services, basing on quantitative forecasting methodologies for analysis of historical data.

3 System architecture

A typical smart home is characterized by a distributed system where heterogeneous devices and appliances need to perform joint execution of tasks in an efficient manner to be really interoperable. Indeed, being distributed architectures, smart home environments need a certain degree of interoperability to manage sub-systems which are usually developed in isolation and thus feature different operating systems and connectivity services (Perumal et al., 2008). Although recent advances in Information and

Communication Technologies (ICT) and Internet of Things (IoT) have led to the development of smart tools intended for smart home environments, the interoperability between typical home appliances still remains an open issue (Chen et al., 2009).

In order to overcome the issue of the interoperability between existing heterogeneous home devices, the proposed system features a centralized architecture model, shown in Fig.2, where the Central Control Unit (CCU) represents the data-aggregation gateway and the decision-making core of the system, allowing the interconnection and the interoperability of different home appliances, sensors and actuators within the smart home environment through powerline and/or wireless technologies. More specifically, the communication between the CCU and the existing heterogeneous home appliances is achieved by the use of a set of smart peripheral devices connected to such appliances, called “smart plugs” in Fig.2, which allows providing additional intelligence and connectivity services to the system. In particular, these smart objects carry out the monitoring of the energy consumption and the managing of the activation/deactivation of the connected electrical appliances.

Moreover, in the proposed model, the CCU communicates with another smart peripheral device, called “smart box” in Fig.2, which carries out the monitoring of the overall energy consumption in the considered home environment. The “smart box” is also able to integrate the energy supplied by the power grid with the energy provided by a local cogeneration system and/or a local energy storage system, and to manage the charging of the latter.

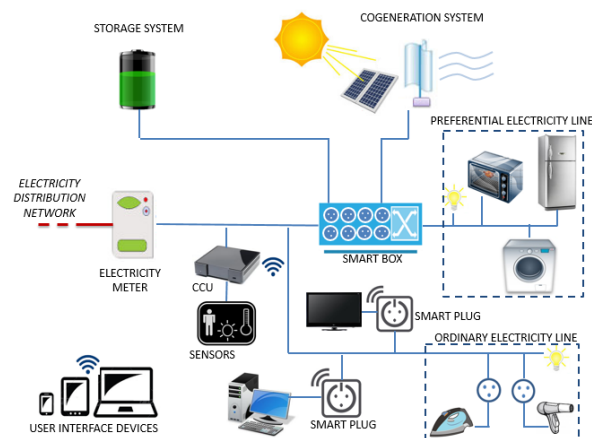

Fig. 2. Architecture of the proposed system

4 Data Management Model

According to the devices' interoperability and the users' needs, the information management is fundamental to achieve efficient solutions for SHEs in terms of energy and cost saving, as well as comfort and safety. In the proposed architecture model, the presence of a set of peripheral devices, such as sensors, smart plugs and smart box, makes available a large amount of data, which need to be collected and handled to make decisions.

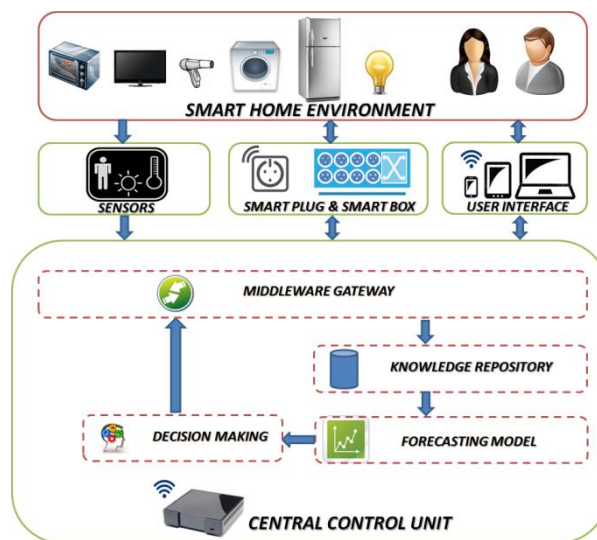

Fig. 3. Flow of information in the proposed knowledge-based management model

To this purpose, we propose a centralized knowledge-based management model, whose dataflow is shown in Fig.3. As already stated, the Central Control Unit (CCU) represents the data-aggregation gateway of the system. Indeed, it interacts with all the peripheral devices of the systems through powerline and/or wireless technologies, and with the users through web-based or mobile interface Apps. Every information related to machine-to-machine and machine-to-human interactions is collected through a Middleware Gateway and stored in real time in the Knowledge Repository. Then, by taking into account the different information categories and devices' functionalities, data from different devices of the system are interpreted and processed by the CCU for achieving smart home interoperability. Thereby, the management system can perform

automatic actions for intelligence-based energy-control services, associated for example to the charging of the energy storage system, to the activation/deactivation of an appliance connected to a smart plug, and so on, with reference to a specific set of decision algorithms and interoperability rules. Clearly, as described in Fig.3, the automated decision-making capability of the proposed system requires the implementation of quantitative forecasting methodologies for analysis of historical data in order to provide the successful prediction of energy consumptions and state conditions of the considered smart home environment and, consequently, the adaptability of the system to the user's habits and needs (Das and Cook, 2005). For example, accurate forecasting allows planning energy-saving and cost-saving actions, such as suggesting which are the best time slots for using some home appliances (e.g., the washing machine, the dishwasher, etc.), or choosing whether to activate/deactivate the electrical appliances connected to the smart plugs, or else suggesting when it is most convenient to recharge and use the energy storage system managed by the smart box or which energy source to be used for charging the energy storage system among those available (i.e., the cogeneration plant or the traditional power grid).

4.1 Forecasting methodologies for home energy consumption

Energy consumption forecasting is greatly challenging. Worldwide energy consumption is rising fast because of the increase in human population, as well as the continuous pressures for better living standards. Forecasting methodologies are essential not only for accurate investment planning of energy production and distribution, but also to promote best practices in energy consumption in smart home environments.

Over the years, different forecasting techniques have been proposed to model the electricity consumption, both in the classical literature on the time series modeling and in the machine intelligence research. In (Feinberg and Genethliou, 2005) and, more recently, in (Hahn et al, 2009), reviews of different forecasting methods are provided. In particular, Hahn et al. distinguish forecasting methods firstly by the time-horizon, highlighting the dominance of short-term load forecasting methods in the scientific literature

Taylor and McSharry (Taylor and McSharry, 2007) discuss short-term load forecasting (from one hour- to one day-ahead) using standard forecasting methods with seasonal autoregressions and exponential smoothing which are also carried out in a periodic fashion by treating each hourly load as a daily time series, while Cottet and

Smith (Cottet and Smith, 2003) adopt Bayesian procedures for forecasting high-dimensional vectors of time series. Mohamed and Bodger (Mohamed and Bodger, 2005) propose a model based on multiple linear regression analysis, taking into account economic and demographic variables, while Al-Ghandoor et al. (Al-Ghandoor et al., 2008) define a forecasting method based on multivariate linear regression of time series in order to identify the main drivers behind electricity consumption.

Zhao and Magoules (Zhao and Magoules, 2012) propose a review on forecasting methods for building energy consumption, classifying forecasting methods into two main categories: classical time series and regression methods, and artificial intelligence and computational intelligence methods, underlining benefits and limits of proposed approaches.

Moreover, several authors (Zhao and Magoules, 2012; Ahmad et. al, 2014) point out the importance of hybrid approaches which combine two or more different approaches in order to overcome some drawbacks of the original methods.

Starting from the approach presented in (Soares and Medeiros, 2008), we propose a hybrid methodology for forecasting energy consumption and appliances utilization in smart home environment by taking into account the quantitative analysis of historical data. In particular, this methodology is based on a deterministic forecasting method (that includes seasonal component and exponential smoothing) for predicting the overall home energy consumption, and a probabilistic approach for forecasting hourly energy consumption of each smart home appliance.

Firstly, in order to define appropriate models for energy consumption forecasting, it is necessary to identify the characteristics of time series related to the historical energy consumption data. Harris and Lon-Mu (Harris and Lon-Mu, 1993) has analysed a 30-years data series from South Eastern States of USA in order to study the dynamic relationships between electricity consumption and other variables, such as weather and user behaviour, finding a high component of seasonality in electricity demand.

Even if the exact shape of the load curve depends on the region, the climatic conditions and the consumers' behaviour, long-term time series (about one year) present a specific seasonality: indeed, the electricity demand is generically high on cold days (due to electric heating), as well as on hot days (due to the increased usage of air-conditioning) (Hippert et al., 2001). In particular, it is possible to observe two seasonal cycles in yearly home energy consumption: an intra-daily cycle (i.e., the daily load curve or load profile)

and a weekly cycle. Because of work habits of house occupants, the weekly cycle usually shows two main groups: weekdays and weekends (Taylor and McSharry, 2007). While in office buildings the operation time is normally in working hours, usually starting from 8am until 17pm, in the residential sector, the electricity usage is maximum in the evening when all family members are at home (Ahmad et al., 2014). Of course, additionally “regular” exceptional cases (e.g. holidays), can be identified (Soares and Medeiros, 2008).

These considerations about characteristics of time series related to home energy consumption lead to choose, among forecasting methods based on quantitative analysis of time series, those that take into account the seasonality component. To this purpose, the standard Holt–Winters exponential smoothing formulation has been extended in order to catch the two seasonal cycles (i.e., intra-daily and weekly) observed in the electricity demand time series. This leads to the introduction of an additional seasonal index in the original formulation, as well as an additional equation for the introduced index.

Let us consider $y_t, t = 1, \dots, T$ as the historical time series of hourly load in a smart home environment. We indicate with D and W , respectively, the intra-daily and the weekly seasonality components. Assuming that $y_t, t = 1, \dots, T$ is a continuous and regular time series, we indicate a and b as the smoothed level and the linear trend in the long run, respectively. Moreover, indicating with C_D the duration of the daily cycle and with C_W the duration of the weekly cycle, we assume, without loss of generality, that the available historical data are sufficient to cover an integer number $k_D = \frac{T}{C_D}$ of daily cycles and an integer number $k_W = \frac{T}{C_W}$ of weekly cycles.

Therefore, the formulation of the chosen forecasting model, based on the multiplicative seasonality, is given by

$$\left\{ \begin{array}{ll} a_t = \alpha \frac{y_t}{D_t W_t} + (1 - \alpha) a_{t-1} + b_{t-1} & t = 1, \dots, T \quad (1) \\ b_t = \beta (a_t - a_{t-1}) + (1 - \beta) b_{t-1} & t = 1, \dots, T \quad (2) \\ D_t = \delta \left(\frac{y_t}{a_{(t-C_D)} W_t} \right) + (1 - \delta) D_{(t-C_D)} & t = C_D + 1, \dots, T \quad (3) \\ W_t = \gamma \left(\frac{y_t}{a_{(t-C_W)} D_t} \right) + (1 - \gamma) W_{(t-C_W)} & t = C_W + 1, \dots, T \quad (4) \\ p_T(\tau) = (a_T + \tau b_T) D_{T+\tau} W_{T+\tau} + \omega^\tau \left(y_T - ((a_{T-1} + b_{T-1}) D_T W_T) \right) & (5) \end{array} \right.$$

Assuming that the forecast origin is T, in equation (5) $p_T(\tau)$ represents the τ -step-ahead forecast, while the term involving ω^τ represents an adjustment for first-order autocorrelation. The smoothing parameters $\alpha, \beta, \delta, \gamma \in [0, 1]$ and ω are estimated in a single procedure by minimizing the sum of squared one step-ahead forecast errors, while the initial values for the level, trend and seasonal components are estimated by averaging the early observations. In our implementation of the method, the duration of the daily and weekly cycles, i.e. C_D and C_W , have been set as follows: $C_D = 24$, $C_W = 168$.

While this approach is useful for appropriately predicting the overall energy consumption in a smart home environment (because of the regularity of the electricity demand time series), such model is not well suited for forecasting the energy consumption of each device/appliance within the SHE, essentially due to the presence of many null values in the time series of single appliances (because of their discontinuous usage). For this reason, in this case, we treat each hour of the day as a separate time series, according to what reported in (Soares and Medeiros, 2008).

Let us assume $A = \{A_1, \dots, A_n\}$ as the set of appliances in our SHE and $J = \{J_1, \dots, J_m\}$ as the set of days accounted in the time series horizon. Therefore, for each appliance A_i , and for each hour h of the day, we consider a binary vector $v^{i,h}$ where each element $v_j^{i,h}$ can assume the following values:

$$\begin{cases} 1 & \text{if the appliance } i \text{ was turned on at hour } h \text{ of the } j\text{-th day} \\ 0 & \text{otherwise} \end{cases}$$

In other words, for each appliance i , we have a set of 24 m -length vectors (where m represents the number of days accounted in the time series horizon), whose $v_j^{i,h}$ elements represents the state (on/off) of the i -th appliance during the h -th hour of the j -th day. Similarly, we consider a vector $w^{i,h}$, where each element $w_j^{i,h}$ contain the load absorbed by A_i during the h -th hour of the j -th day.

In order to identify a certain regularity in the binary sequence $v^{i,h}$, and then predict if the next value (i.e., $m+1$) will be 0 or 1, each vector has to be analysed. Initially, the pattern to be searched has unit length and corresponds to the last value of the vector $v^{i,h}$. Therefore, it is necessary to count the number of times that this pattern is repeated (*count pattern*) in the vector $v^{i,h}$ and the number of times that such pattern is followed in the

sequence by a 1 (*count one*) or a 0 (*count zero*). This allows calculating the probability of the next value as follows:

$$P(0|pattern) = \frac{\text{count zero}}{\text{count pattern}} \qquad P(1|pattern) = \frac{\text{count one}}{\text{count pattern}}$$

This procedure has to be repeated by increasing, in each iteration, the length of the pattern to be recognized (therefore, in the second iteration, the pattern will be composed by the last two values of the vector $v^{i,h}$, in the third iteration by the last three values of $v^{i,h}$, and so on). Of course, the predicted next value will be associated to the one with the highest probability among the various analysed patterns. If such value will be 0, the algorithm stops, otherwise it is necessary to estimate the load $w_{j+1}^{i,h}$ that the appliance A_i will absorb during the next day at the h -th time slot. In this case, we consider the probability distribution of the absorbed load $w^{i,h}$, excluding null entries.

5 Conclusions and future works

In line with the goals of Europe 2020 strategy, energy resource saving represent a key issue for sustainable development. Among the various technological solutions for reducing energy consumption in home environments, the so called “building automation and control systems” (BACS) represent high performance and low impact solutions for energy efficiency. In this context, the proposed system offers in prospect the opportunity to improve the energy performance and electricity cost saving of residential buildings, featuring at the same time a low architectural impact due to the use of wireless and/or powerline technologies. This makes such kind of solution well suitable to existing houses.

The development of the hardware components (such as smart plugs, smart box and Central Control Unit) as well as the knowledge-based management software of the system is still ongoing. Further works will concerns the testing of the system prototype in laboratory and in real home environments with different characteristics in order to validate our SHE architectural framework and the proposed management model in terms of cost and energy saving.

For what concerns the forecasting methodology, we intend to compare the performance of our model with other sophisticated models proposed in literature, such as

the seasonal ARIMA (Autoregressive integrated moving average) models, SVM (Support Vector Machine) and neural network approaches.

Is crowdfunding a useful way for a sustainable growth of the territory?

Structured Abstract

A. Introduction. Even though “crowdfunding” can be seen as a relatively recent phenomenon (especially in Italy), it has nonetheless been the subject of numerous studies, especially in recent years. We believe, however, that these studies have not provided a comprehensive examination of the phenomenon (Belleflamme et al. 2011; Lambert and Schwiendbacher 2010). So, it might be posited that the existing literature has only provided a description of the main and most general characteristics of crowdfunding, which is a vast and often many-sided phenomenon. Substantial areas of research and important aspects still remain to be covered. Even if it is now commonly held to represent an autonomous phenomenon (Mollick, 2013), the most common and well-known definition of crowdfunding refer to the phenomena of crowdsourcing (Poetz and Schreier, 2012) and microfinance (Morduch, 1999). More specifically, according to a wide number of authors (Larralde and Schwiendbacher, 2010), crowdfunding can be analyzed as a category of the wider ‘crowdsourcing phenomenon’.

On the basis of these definitions, the main components of crowdfunding are:

1. a large group of people (crowd),
2. a provision of financial resources (funds),
3. internet-based means, peer-to-peer, websites or other online tools (Lin and Viswanathan, 2013),
4. a specific objective: a project, specific initiatives or other specific purposes. Burkett (2011) also considers collections made by fans of bands to represent a form of crowdfunding,
5. a form of “return” for the crowdfunders, which can also be of a “moral” nature (for example in a free distribution or donation), or another type of “reward”, gratification or right to vote and to constitute a part or category of the wider, more general concept of crowdsourcing.

Analyzing the studies that have been achieved so far, it does not emerge clearly what could be the contribution on the territory and on the community, in terms of social, environmental and economic sustainability, that crowdfunding cause through its fundraising activities and the subsequent projects financing.

Too often the phenomenon of “crowdfunding” is limited as a new business model, exclusively aimed to achieve profits, without considering its potential as a mean of fundraising for the growth and development of the territory and the community.

B. Aim of the research. The aim of the research is to examine some Italian crowdfunding projects in order to assess the sustainability of the value-creating model for the community. In particular, the study will focus on:

1. firstly, the process and the criteria used to identify the platforms for the analysis. The study considers the 45 existing Italian “crowdsourcing” platforms (already active) on March 2014, identified through the platform crowdfunding.it and the analysis of the companies’ Ateco identification code.
2. secondly, the analysis of the platforms to find out if and how each project is addressed to the territory.
3. thirdly, the analysis of each project in order to find out:
 - the crowdfunding model;
 - type of project;
 - the amount that has to be financed ;
 - amount of financial resources already obtained;
 - donors characteristics;
 - type of sustainability (environmental, social, economic,).
4. finally, the identification of a sustainability measurement model developed through the correlation between the characteristics of the projects funded and the impact on the territory.

Keywords – crowdfunding, platform, crowdsourcing, sustainability, value creations

Paper type – Academic Research Paper

1 Introduction

The new social technologies have transformed the world-wide-web from a platform for passive use of contents in a place where users can actively contribute to the creation of content and sharing of ideas. The spread of social networks, that facilitate the communication and the exchange of messages by creating a personal network of contacts, made the communication between people (and often between people and companies as well) faster and more efficient.

This innovation and flexibility led to the creation and the development of crowdfunding, which represents the collaborative process with which many people participate with their own money to finance a project.

Crowdfunding in Italy is a very recent phenomenon ⁽¹⁾. The first platform was launched in 2005 (Produzionidalbasso), but recently it is having a remarkable success. In less than 10 years, the number of the Italian crowdfunding platforms increased up to 49.

It's indisputable that, as well as for social networks, this phenomenon represents a "fashion". Kickstarter, founded in 2009, is the best known and used platform in the world; it reached \$ 1 billion in funding, with the participation of more than 6 million people by funding more than 59,000 creative projects. But it should be immediately pointed out that the Italian situation is really far from these numbers. Currently there are 45 active platforms (plus 4 ready to get launched); considering that most of those were created just in the last 2 years, we can say that the Italian crowdfunding is still at an embryonic level.

The most important aims of a crowdfunding platform are:

1. communication: proposing projects and fundraisers, the crowdfunding platforms make themselves known to a global universe, by web;
2. financing: fundraising for a variety of purposes is the main goal of crowdfunding platforms;
3. philanthropy: fundraising is often the time to charitable or humanitarian projects.

Moreover, there is no doubt at all that these fundraisers have a strong impact on the territory and the environment. Some platforms, like "Finanziamilfuturo", operate exclusively at a local level to give priority to their own territory, enriching it with loans.

For this reason, we can say that crowdfunding has - in term of sustainability - an impact that is:

- economic,
- social,
- environmental.

The projects devoted to the environment find plenty of space among the "bottom up" loans. Among the platforms that are open to individuals and businesses ideas, one is entirely dedicated to sustainability and the protection of the territory. Its name is Kendoo and it requires projects to be submitted according to certain guidelines. First of all, the project should never be vague but must have a specific purpose, such as protecting the

⁽¹⁾ There are many studies about the phenomenon: for example, "Analisi delle Piattaforme di Crowdfunding Italiane", Daniela Castrataro (twintangibles & crowdfuture) e Ivana Pais (Catholic University of Milano), 2013, www.italiancrowdfunding.org and Collaborative Economy Observatory, Departement of Management, University of Turin, where many researchers works to study the phenomenon (www.collaborativeeconomy.unito.it).

environment, improving the living conditions of the community and other charitable initiatives. An example could be the reconstruction of the areas affected by the recent earthquake in Emilia where a sustainable development of these areas has been promoted through a participatory process that allows to formulate and share projects by putting them in a crowdfunding platform to implement their realization. An other example is the reconstruction of the “Città della Scienza” in Naples where 900.000 Euro had been collected by Deryv platform.

In other words, the crowdfunding platforms are not just fundraisers that have an aim in themselves, but they promote integration into a broader system that is the participation and the creation of value in the area, using alternative models that ensure sustainability in the contexts of reference. These platforms are, therefore, an attempt to build a model that starts from the people and facilitate a mechanism that fit best to the Italian specificity.

The paper proposes, therefore, at first, a theoretical discussion on the conceptualization of the phenomenon crowdfunding and sustainability, in its various dimensions, framed in the context. Next, we describe the structure of the interpretative model proposed for the assessment of the sustainability of crowdfunding. In this section, particular emphasis is given to the social aspects, which are then subject the empirical application, as described in the fourth part of the contribution. In the final part of the paper we discuss the results and draw attention to their implications for spatial development.

2 Literature review

The crowdfunding phenomenon can be defined as “a collective effort of many individuals who network and pool their resources to support efforts initiated by other people or organizations. This is usual done via or with the help of internet. Individual projects and businesses are financed with small contributions from a large number of individuals, allowing innovators, entrepreneurs and business owners to utilize their social networks to raise capital” (De Buysere, Gajda, Kleverlaan, Marom, 2012). The phenomenon concern anthropologic, social and economic aspects, in which we have three specific elements:

1. crowdsourcing
2. contribution

3. web

The crowdfunding can be defined on the basis of the needs that it satisfies. In particular, if the needs satisfied relates to sharing, on the one hand, and economic and financial support on the other, we are dealing with homogeneous companies, which belong to the crowdfunding sector. If, however, the needs satisfied relate to sharing and material or moral support, the relevant model is “crowdsourcing”, which describes a business sector with different characteristics from those of the “crowdfunding” sector. The two business-models belong to the macro phenomenon of “sharing economy” (Alfiero, Indelicato, Rainero, Secinaro, Tradori, Venuti, 2014).

The crowdfunding phenomenon has a sustainable, social and environmental impact, so that it could be considered a powerful instrument for economic and social innovation⁽²⁾.

Economic sustainability is defined as the ability to generate a sustainable income and employment and to ensure a rational use of available resources. This means the ability of a complex organization to perpetuate itself over time. Social sustainability can be defined as the ability to ensure fair and open access to goods and welfare conditions. Regarding the analysis of the concept of sustainability, its definition must necessarily be derived from a synthesis of the relevant scientific literature and politics. What emerges from this review is the vagueness of the concept, which, while it limits the definition, on the other hand it can be applied to many different fields of study (O’Riordan, 1988; Redclift, 1991; Jacobs, 1999). The most general definition of sustainability, which still represents the starting point for the world of politics and international science, can be found in the “Brundtland Report” (1987) of the World Commission on Environment and Development, chaired by the Prime Minister of Norway at that time, Mrs. Gro Harlem Brundtland. Sustainable development in this document refers to “ensure that it meets the needs of the present without compromising the ability of future generations to meet theirs. [...] Sustainable development, far from being a final state of harmony, it is rather the process of change in which the exploitation of resources, the direction of investments, the orientation of technological development and institutional change are made consistent with future needs as well as with the current” (WCED, 1987).

⁽²⁾ *Social innovation can be defined as development and implementation of new ideas (products, services and models) to meet social needs and create new social relationships or collaborations. It represents news responses to pressing social demands, wick affett the process of social interactions. Guide to social innovation, European Commission – 2013.*

So, it is important to define clearly the dimensions of sustainability as well. The most shared approach is the so-called “Triple Bottom Line” (TBL; Elkington, 1998), which locates the essence of the sustainability of any system in the three spheres of environment, society and economy. Despite many criticisms, especially theoretical articulation of sustainability in which this size has been submitted in time (Lehtonen, 2004), the TBL seems to be a useful practical tool for organizing the evaluation of the level of sustainability in a given system. At this point, it is necessary to define in a more detailed way the significance of these three spheres, considering the literature that has been largely concerned with environmental, social and economic sustainability. In particular, considering the environmental aspect, it refers to the work of Goodland (1995) that, following the approach of Daly (1988), identifies two categories of environmental services: “the use of renewable and nonrenewable resources on the source side, and pollution and waste assimilation on the sink side” (Goodland, 1995). Environmental sustainability is therefore identified as a series of restrictions on the use of such services. As for the “source side”, the use of renewable raw materials should not exceed their intrinsic regenerative capacity, while the use of non-renewable raw materials should be at such a rate as to permit the emergence over time of new technologies that can replace them. The maintenance of the “tank” is instead linked to the capacity of absorption and assimilation proper to a specific ecosystem, which must not be exceeded to avoid compromising in the future the functionality of absorbing waste and pollutants.

With regard to the social dimension, the literature has several conceptualizations, which can be found in the classification provided by Lehtonen (2004). The most convincing in terms of the applicability at an operational level, it is probably the one referred to the concept of ‘social capital’, defined by Robert Putnam as «features of social organizations, such as networks, norms, and trust, that facilitate action and cooperation for mutual benefit» (Putnam et al., 1993, 35-36). The capital thus refers to the associations and interactions between members of a community characterized by trust and reciprocity, which are expressed primarily in two forms: the construction of new ties between members (social capital “bridging”) and the fortification of existing relationships (social capital “bonding”) (Gittel & Vidal, 1998). Social sustainability can be seen, according to this point of view, as maintaining and strengthening social ties in order to facilitate action and cooperation among the members of the community, with the aim of pursuing shared goals.

Finally, regarding the economic dimension of sustainability, it is known the difficulty of a widely accepted conceptualization according to the neoclassical economy principles and the incompatibility of the assumption of perfect substitution between factors of production, in particular natural resources. More convincing seems the bio-economic approach (Georgescu-Roegen, 1971, Daly, 1973), which instead of focusing on the value (replaceable) it considers the physical substance of resources (irreplaceable and limited).

According to this perspective, the economic sustainability is the characteristic of a system that can perpetuate itself in an independent way within its physical limits. Moreover, the need of a sufficient flow of well-being which falls equally on all members of the systems should be considered as an output of the economic system.

Applying the concept of sustainability, as detailed below, it is now necessary to define what is meant by both “sustainability of crowdfunding” and “sustainable crowdfunding”.

In general, defining sustainability as a property of a system and the ability of a complex organization of processes to be perpetuated over time retaining its structure and its functions, it can be said that the level of sustainability of the crowdfunding phenomenon is related to the possibility that the way in which it is organized ensure that it will operate in the future in the same way as platforms operate at the moment.

Starting from the assumption that “if you can not measure a phenomenon, you can not even handle it” (Econometrics Sciences), we could wonder if sustainability can be really measured. The first major challenge to the development of this interpretation model is its hierarchical structure. The identification of indicators, in fact, must descend from a logical process that proceeds from concept to the object of measurement instruments for evaluation. This process is organized in a hierarchical way because each component must find its meaning in the context of what precedes it.

Adapting a well-known work of Lazarsfeld (1958), Maggino (2009) identifies four basic hierarchical levels:

- the concept, which defines the phenomenon, its context and the main aspects that characterize it;
- the survey areas, which represents a specific aspect of the concept;
- latent variables, namely the elements to be considered within each survey area; those that cannot be directly observed are expressed by indicators;
- elementary indicators, capable of describing each of the identified variables, which must be expressed quantitatively through special indices.

The result of this process is a tree model that, starting from the definition of the concept, comes to the identification of indicators to be measured through a logical procedure that ensures the consistency of the evaluation with the theory of reference.

3 Sample

Crowdfunding has now emerged as a viable, scalable alternative to public and private finance. These developments have implications for how governments frame economic development programs and leverage public investments.

Behind the scenes, big global companies are running the rule over crowdfunding as a way to leverage their innovation portfolios into the marketplace. Crowdfunding is helping enterprises interacting with their customers and validating R&D outputs.

The four crowdfunding categories are:

- Reward based ⁽³⁾
- Donation based ⁽⁴⁾
- Equity based ⁽⁵⁾
- Social Lending based ⁽⁶⁾

The platforms analyzed had been divided according to their “age” (birth year). The first platform was launched in Italy in 2005. In 2013, 24 platforms, slightly less than half

(3) This business model is used by project owners who want to collect donations for a specific project and can give (often small) non-financial rewards in return. The rewards are of a symbolic value and provided by the investee. They are usually much lower than the donation amount, to ensure there is enough money left for the project.

Nevertheless, the perception of the value can be much higher, for example special VIP tickets as a reward for a higher donation. A reward in this context should not be understood as a token of appreciation. In general, the parties do not consider it a legally binding obligation to provide the goods and do not classify it as a sale. When the different reward-levels are chosen wisely, it is possible to receive a much higher average donation than with a pure donation-based approach [A Framework for European Crowdfunding (2012)].

(4) This model is used to attract donations for specific projects. Unlike with traditional fundrasing, donations are collected and ear-marked for a specific project. Because funders know that their money will be used on a very specific project, they are more willing to donate higher amounts per person [A Framework for European Crowdfunding (2012)].

(5) When a company wants to attract an investment from a group of people, instead of funding by a business angel or another private investor, this is called equity crowdfunding. Some funders are primarily interested in investing in projects that share their own values, that are locally engaging, or that create jobs in their community. Others have a real knowledge of what the market, project, or company is addressing and desires to bring funds and expertise to the success of the project. This practice is very similar to business angels. Equity crowdfunding also generally includes equity-like arrangements, offering the same payoff as equity (shares), and where the “funder” is actually merely a creditor who has a contractual right to receive that payoff [A Framework for European Crowdfunding (2012)].

(6) With lending-based crowdfunding, a company will borrow money from a group of people instead of a bank. The role of the platform can be diverse. Some of the platforms will act as a middle-man and will also make the repayments to the lenders, where other platforms act only as match-makers and the borrower and lenders will be connected when the deal is closed [A Framework for European Crowdfunding (2012)].

of all those existing at the moment (45), were launched and in the first two months of 2014 three more platforms have appeared in the market and other four are ready to be launched soon. This numbers shows clearly how crowdfunding is a rapidly growing phenomenon in Italy, as can be seen from Figure 1.

Figure 1 *The Crowdfunding in Italy by year of birth*

In Figure 4, it is shown the different typology of crowdfunding platforms dislocated in Italy.

Figure 4 *The typology of Crowdfunding platform in Italy*

Source: own elaboration

The market in which they operate has been analyzed as follow:

National	23
Local	15
National / International	7
Total	45

Figure 5 Crowdfunding geografic market

Source: own elaboration

Analyzing the platforms, it has been noted that there are different ways of financing the projects. The three most important types of collection are:

a) **All or Nothing (Aon)**. There is a minimum threshold to be collected for the project by tying its implementation to a budget. At the expiry time of the collection two possible scenarios could appear:

- The collection has reached or exceeded the minimum constraint: in this case the amount collected will be credited to the applicant.
- The collection has not reached the minimum threshold: the money is entirely returned to the donors, without charges added by the platform, as the collection is based on a commitment to pay but not an actual transaction.

b) **Keep it All (Kia)**: in this case the achievement of all or only a fraction of the sum is a non-binding statement prefixed to the project. The proposer collects all the contributions as they are paid. This type of collection offer great support to those projects that can be started before the end of the collection, and would be carried out regardless of financial support resulting from the collection. The immediate collection of the author binds them to the realization of the project in relation to donors through the recognition of potential rewards.

c) **Fundraising (permanent collection)**: unlike the Aon and Kia, it does not require time or target constraints. The credit is immediate as for the Kia. It is normally used to finance continuing operations over time by entities such as legal association, institution or non-profit organizations.

The data obtained are:

All or nothing	20
Keep it all	10
Fundraising	6
All or nothing + Keep it all + Fundraising	5
Keep it all + Fundraising	4
<hr/>	
Total	45

Figure 6 *The types of fundraising*

Source: own elaboration

The institution (entity) that runs the crowdfunding platform could be:

- Corporation or Limited Company
- No-profit organization
- Proprietorship (Sole trader)

Figure 7 *Institutions involved by crowdfunding*

Source: own elaboration

The recipients of crowdfunding platforms are:

- Profit entities
- No-profit entities
- Public sector entities
- Individuals

Figure 8 *Sectors of crowdfunding*

Source: own elaboration

All the Italian platform websites are, obviously, in Italian, but around 50% is also available in English and one of them in Russian too. This clearly shows how the Italian crowdfunding phenomenon is still largely limited to a national and local dimension.

Figure 9 *Platforms Language*

Source: own elaboration

Crowdfunding platform largely use social networks as an important channel of communication. Facebook is used by all the analyzed platforms, but also Twitter is

widely used. Other channels like YouTube, Google+ and Instagram are quite common, but in a much smaller way.

Figure 10 Social networks and crowdfunding

Source: own elaboration

Regarding the analysis of both the users (those who require or give funds) and the visitors (those who simply visit the site), it may be noticed that more than 50% of the crowdfunding platforms have less than 1.000 users. This could be also due to the fact that many platforms have been launched only recently and are linked only with the national market (24 platforms were born in 2013 and 33% refers to a local market).

Figure 11 Users and visitors of crowdfunding platforms

Source: own elaboration

The choices of the market, of the type of users and, of course, the “age” of the platform are all variables that affect significantly the number of users. Moreover, the number of visitors is larger than the number of users as there is a strong curiosity and an increasing interest in the platforms’ activities, but there is still some hesitation in taking advantage of this tool for the collection of funds. The largest number of users is registered for the social-lending platforms, while the highest number of visitors appears in the reward-based platforms.

4 Methodology

In order to reach the research objective, we adopted a double approach to the phenomenon of “*crowdfunding*”:

1. firstly, a qualitative approach, through a study of the Italian platforms and an analysis of the project that they offer for funding;
2. secondly, a quantitative approach, through the analysis of the data obtained from the sample survey of the crowdfunding platforms and some indicators of sustainability (economic, social and environmental sustainability).

As for the qualitative analysis, the research was articulated into different steps. Specifically, they are:

1. Presentation of the Italian crowdfunding projects: topics and platforms;
2. Study of the platforms’ projects through:
 - the analysis of the websites of the crowdfunding platforms;
 - on line questionnaires and surveys;
3. Creation of a database with the most important characteristics of the projects funded (amounts, recipients, territorial effects, ...)

As for the quantitative analysis, we identified some territorial indicators in order to develop a sustainability measurement model for crowdfunding. The indicators are divided into three categories (Economic sustainability, Social sustainability and Environmental sustainability) and are largely based on ISTAT statistics. Those indicators follow the three classical dimension of sustainability, as described in the literature review.

Specifically, the indicators considered are:

1. Economic sustainability:

- a. Regional GDP per capita (as mean deviation from the national average annual growth rate of GDP per capita in the last 10 years),
- b. Regional unemployment rate,
- c. Regional inflation rate (average annual percentage change in consumer price index in the last 10 years).

2. Social sustainability:

– health indicators:

- a. Public expenditure on health (average of the indexes of public health expenditure in the last five years),
- b. Health expenditure of families (average percentage over the GDP in the last 10 years),
- c. Hospital offering (average number of hospital beds per 1000 inhabitants in the last 5 years),

– social indicators:

- a. Social Services (average percentage of spending on social services and assistance over the GDP in the last 5 years),
- b. Municipalities with services for children (percentage of municipalities with childhood services compared with the regional supply in the last 10 years),

– Education indicators:

- a. Public expenditure on education and training (average percentage over the GDP in the last 10 years),
- b. Permanent formation (percentage of 25-65 years old people participating in educational projects in the last 10 years)),

– Culture indicators:

- a. Museum visitors (people aged six or more years old who visited a museum in the last 12 months),
- b. Spending on culture (percentage of household expenditure for cultural activities),
- c. Number of books read (people aged six or more years old who have read at least one book during the last 12 months).

3. Environmental sustainability:

- a. Expenditure on environmental protection (average percentage over the GDP in the last 5 years),
- b. Municipal waste deposited in landfills (Kg per inhabitant).

Then, for each dimension of the "triple bottom line model", three indicators had been computed by grouping Italian Regions in four big areas (NorthWest, NorthEast, Center and South+Islands). Those indicators are capable of expressing in a concise and effective way the degree of sustainability of each area in terms of economic, social and environmental features.

The sustainable impact of crowdfunding platforms, in terms of funds raised and used to finance projects in sustainable connection with the territory, had been compared with the three indicators previously defined, in order to understand and define the "role" that the crowdfunding platforms can play in a sustainable scenario.

5 Major findings

From the questionnaires (but without considering both the Equity-based and those which are still in the "launch phase" and thus not active yet), we found out that the total projects successfully presented at the beginning of February 2014 were 24.447, among which:

- Fully funded 14.390 (58.86%)
- Partially funded ⁽⁷⁾ 10.057 (41.14%)

Figure 12 *Projects of crowdfunding platforms*

Source: own elaboration

⁽⁷⁾ This category includes projects that, at the date of completion of the questionnaire, had reached at least a fifth of the total required for those projects submitted on the platforms that adopt the model All or Nothing, or a value at least equal to one-fifth of that required for those adopt the model Keep It All, or a value of 800 euro for projects of fundraising.

The total amount of funds collected for the projects (both fully and partially funded) is 42.734.723 Euro⁸, distributed as showed in the picture below.

Reward-based	7.178.123
Equity-based	(not considered)
Donation-based	1.992.600
Social lending	33.564.000
Total	42.734.723

⁸ At February 2014.

To determine the sustainable impact of the crowdfunding Italian platforms, the study is directed to the analysis of those projects and the relative amounts of funding reached that can be considered with “sustainable social aims”. This “sustainable social aims” are referred to the three dimension of social, economic and environmental sustainability. The projects have been divided in the following categories:

- Social Assistance
- Health care
- Social and health support
- Education
- Cultural, historical, artistic heritage
- Environment

For each category, the total amount of funds collected with the crowdfunding platform has been computed. Around 75% of the total funds raised (approximately equal to EUR 32 million) are intended to finance projects with a social-economic impact in at least one of the considered categories.

As shown in the picture below, almost all the funds collected by the donation-based platforms have a social impact (92%), followed by the lending platforms (78%) and the reward-based ones (54%).

Figure 15 *Distribution of fundraising.*

Source: own elaboration

Around 65% of the funds is devoted to the development, the preservation, conservation and protection of cultural, historical and artistic heritage. Education projects are the second most funded, followed by social assistance. The environment protection, management and development, at the moment, is the category that received the lowest amount of funds.

Figure 16 Destination of fundraising

Source: own elaboration

To understand the impact of the phenomenon on the territory, we analyzed the distribution of funds by geographical area, considering 5 categories (4 national zones: NorthWest, NorthEast, Center, South and Islands, plus a residual general category for foreign projects). The geographical impact of the projects has been identified for each type of sustainable project considering the area in which the object or the purpose of the project is located.

The picture below shows the percentage of collected funds for each category and their impact on the territory.

Figure 17 Categories and geographical areas of funds

Source: own elaboration

Finally, to define the "role" that the crowdfunding platforms can play in a sustainable scenario, we compared the amount of funds raised in each geographic areas, with the highlights coming from the economic, social and environmental KPI (based on Istat datas) of the same zone.

In the following graphs, each dimension of sustainability is compared with the value created by crowdfunding in the same area.

It is especially in the South and in the Center of Italy that crowdfunding could be a really valuable tool to improve the economic sustainability of the area.

Under a social perspective, crowdfunding is a tool that is already widely used throughout the territory, in particular is a good alternative to finance all those projects, with a specific social value, that cannot rely any more on funds coming from the public sector (mainly because of the increasing shortage of public funds).

Finally, looking at the environmental dimension, it is clear that the crowdfunding platforms are also used to finance projects for environmental protection and the preservation of the eco-system mainly in those areas (like North-East) where the territorial indicators already show a significant attention to environmental concerns.

6 Conclusions

The study shows that crowdfunding is a way for sustainable growth of the territory in Italy. In particular, we studied the sustainability as declined in three “classical” dimensions (environmental, economic and social). As for the social dimension of the phenomenon it is possible to assess that crowdfunding starts to be used in Italy, mainly as a good alternative to finance those projects, with high social value, that cannot rely any more on funds coming from the public sector. Looking at the environmental dimension emerges that the crowdfunding platforms are mainly used to finance projects for environmental protection and the preservation of eco-system in those geographical areas (North-East), where territorial indicators already show significant attention to

environmental concerns. Our analysis also showed that crowdfunding can be a valuable tool also to improve the economic sustainability of each territory and geographical area. It is therefore important to consider the high-impact and multi-faced possible spillovers of this phenomenon, that represents an important form of support financing the socio-economic growth of any area.

It should be pointed out that in Italy at the moment the crowdfunding phenomenon, although it presents considerable growth rates, is still at an embryonic level, especially compared with the international situation. This limit clearly appears in the “national” dimension of the Italian crowdfunding platform (around 90% of the users are national ones) and the lack of international extent.

The study will be developed further more with the identification and application of a quantitative sustainability measurement model for crowdfunding.

Structured Abstract

Purpose – The goal of the paper is to clarify the concept of social innovation, by assuming a compact working definition of social innovation, which keeps its key elements, and providing a tool to understand which actors intervene in the process, in which phase, and according to which driver.

Design/methodology/approach – Following the example of Dangelico and Pontrandolfo (2010), who developed the Green Option Matrix to characterize green products and practices, we propose a three-dimensional matrix called Social Option Matrix (SOM): its dimensions correspond to feature of social innovation mentioned by the literature, and the attendant cells represent the possible combinations of the values assumed by the dimensions. Finally, we populate the cells of the SOM by 25 real instances of social innovations discussed in the extant literature.

Originality/value – The paper provides a tool to investigate those aspects raised by the scholars which needs deeper search. Moreover, by observing the population of each cell of the matrix, the tool can be used to investigate the existence of patterns in the distribution of the instances and to analyse whether other variables, besides the dimensions of analysis, generate specific patterns.

Practical implications – Beside the theoretical implications (i.e. to make the concept of social innovation clearer and narrower), the identification of eventual patterns can be useful for practitioners. The actors involved in the development of social innovations, indeed, can adopt the SOM to better understand what a social innovation is as well as to increase their awareness on what they (can) do with respect to social innovation, and to improve communication towards stakeholders.

Keywords – social innovation, social option matrix, SOM, literature review, user involvement

Paper type – Academic Research Paper

1. Introduction

The literature on innovation analyses the features, the necessary resources, the processes, the effects, and the implications associated with the development of different typologies of innovation, for example organizational (Wolfe, 1994), technological (Utterback, 1971), architectural (Henderson and Clark, 1990), and, lately, open (Chesbrough, 2003), green (Chen, 2008), user (Morrison *et al.*, 2000), jugaad (Radjou *et al.*, 2012), and responsible innovation (Owen *et al.*, 2013).

Since the seminal work of Schumpeter (1942), the social implications of innovation have been deeply discussed in the literature (Moulaert *et al.*, 2005). Moreover, the sweeping changes concerning the civil society in the last century (let's think for example at the women's suffrage, the spread of kindergartens, the national health service, the growing number of elderly people, and so on) suggest that the pace of social innovation will accelerate also in this century (Mulgan, 2006). This is coherent with the growing number of scholars that in the last two decades have investigated social innovation, as well as with the growing number of centres (in Canada, Australia, USA, UK, Germany, Austria, France, New Zealand), foundations (Young Foundation, Social Innovation Exchange, NESTA), and incubators (Ashoka) spreading all over the world. Recently, the financial and economic crisis has further stressed the importance of the social dimension of innovation even for businesses (Mulgan, 2006; Barroso, Jose Manuel Durao, 2011).

According to Mulgan (2006) social innovation concerns all those fields characterized by issues such as ageing populations, growing diversity, chronic diseases, behavioural problems, crimes, climate change. In these fields the existing models of innovation are failing or stagnant or new possibilities are not being adequately exploited (Mulgan *et al.*, 2007).

Even though the role played by social innovation is presented as crucial, there is an on-going (and growing) discussion about the notion itself, which remains no more than a "buzzword", a "container concept" (Edwards-Schachter *et al.*, 2012), or a "passing fad" (Pol and Ville, 2009).

Among the available definitions: Holt (1971) affirms that "social innovation deals with the application of new social patterns of human interaction", which means "finding new ways for cooperation between people who work and interact in organizations for common objectives"; Moulaert *et al.* (2005) state that social innovation refers to "those changes in agendas, agency and institutions that lead to a better inclusion of excluded

groups and individuals in various spheres of society at various spatial scales”; Tanimoto and Doi (2007) describe social innovation as “the development of new social goods and services addressing social issues, such as welfare, education, the environment, and support for developing countries”.

Regardless the definitions, a few features are considered as key for social innovation. Social innovation may concern a product or service. It improves efficiency, sustainability, effectiveness (van den Hove *et al.*, 2012; Bellantuono *et al.*, 2014) and is able to increase the overall satisfaction of the beneficiary or improve their quality of life (Mulgan, 2006; Pol and Ville, 2009). Solutions provided by social innovation are persistent. The social innovation process consolidates norms (Pavan *et al.*, 2011), reconfigures institutional relationships (Weber, 2012), creates new relationships and social structures, or provides organizational changes.

The literature seems not to have reached a consensus on the definition of social innovation: while there is a general agreement on some features, some others are not always considered. The aim of this paper is to fill this gap: first we assume a compact working definition of social innovation (which keeps its key elements), then we analyse the remaining features, as mentioned by the literature, contrasting them with a set of real instances of social innovation. In particular, we propose a tool named Social Option Matrix, which characterizes every considered instance along each of the features not included in the definition.

The paper is organized as follows. Next Section gives and argues our working definition of social innovation. Section 3 describes the Social Option Matrix. Section 4 presents the considered instances of social innovation and applies the Social Option Matrix to them. Finally, Section 5 shows results and discusses the main findings while Section 6 draws the conclusions.

2. Definition of social innovation

We adopt the following working definition: social innovation is peculiar in that its output addresses the need of a weak social category and its process implies interaction between user and developer (Bellantuono *et al.*, 2014).

The definition above emphasizes two features that shape social innovation, namely the social category to which it is addressed and the social process that is performed.

As to the former, the literature stresses that the potential beneficiaries of a social innovation are categories of people having some common needs or personal conditions (e.g. elderly people, students, women). They include underserved (Young, 2011) or vulnerable population (Cahill, 2010), homeless, poor, disabled, and mentally ill persons (Antadze and Westley, 2010), gender or age categories that are marginalized by the existing power hierarchies (Rodima-Taylor, 2012), unprivileged groups in society (Nussbaumer and Moulaert, 2004), or categories affected by deprivation or lack of quality in daily life and services (Moulaert and Mehmood, 2010). This is consistent with the goal of social innovation, namely the inclusion of these marginalized categories (Loogma *et al.*, 2013; Moulaert *et al.*, 2005; Stam, 2012)

The needs of these potential beneficiaries are compelling (Krull, 2008), urgent, unmet (Mulgan *et al.*, 2007), and emerging (Loogma *et al.*, 2013); in a word, genuine. Nonetheless, the beneficiaries' bargaining power is so low that their needs do not turn into marked demand and therefore remain unsatisfied (Loogma *et al.*, 2013), poorly served, or unresolved within the traditional market rules. Examples of the above concepts are given by microcredit (people may get loan even though they have low income or assets) or time-banks (work can be exchanged without using money).

A second key aspect of social innovation is its social process. Mulgan (2006) notes that people are competent interpreters of their own lives and solvers of their own problems. Based on that, the beneficiary of any social innovation should play an active role during the innovation process: the interaction between beneficiaries and developers helps make bottom-up the process.

Moulaert *et al.* (2005) state that social innovation changes the dynamics of social relations including power relations, thus suggesting that innovation is in the process. Mumford (2002) highlights social interactions among multiple parties, Bock (2012) refers to co-design and co-construction, and Kinder (2010) to co-production. Finally, Edwards-Schachter *et al.* (2011) not only recall the combination of tangible forms of capital (physical, financial), but also include the combination of intangible forms of capital, especially social capital.

The idea of consumers' co-creation alongside producers and users' integration in the innovation process is not new (Edwards-Schachter *et al.*, 2012). It represents a big difference between social innovation and other types of innovation. With this respect,

Bouchard (2012) stresses that social innovations aim at transforming the social relationships at the roots of a social problem.

The role of users is important even in business innovation. Firms are interested in users' opinions on their products and they rely on this feedback, because they can improve or adjust their products to adapt them according to their preferences. This will give them a warranty to succeed. Von Hippel (1985) introduced the concept of lead users as responsible for a larger proportion of innovation (Edwards-Schachter *et al.*, 2012). Morrison *et al.* (2000) argue on user innovation, i.e. innovation by intermediate users or consumer users. Toffler (1981) and Ritzer and Jurgenson (2010) define "prosumers" as people who produce many of their own goods and services.

The social process involved by a social innovation makes beneficiaries and developers interact. Such interaction may occur with diverse intensity. In the case of Aravind Eye Clinics (Bessant *et al.*, 2012) the beneficiaries are involved in the process, but doctors as well as companies providing technical equipment play a key role. On the contrary, in the case of self-build housing, developers and beneficiaries significantly overlap as the houses are developed by the persons that will use them.

To sum up, social innovation empowers people – the beneficiaries who share a common genuine need – through a social process that makes them able to fulfil their need. The social process is a key aspect of social innovation in that it gives emphasis to a large community (rather than a single innovator) in the innovation process. This occurs for microcredit (the guarantee of the community makes the loans to low income people possible), Wikipedia (volunteers produce contents freely available to public), Aravind Eye Clinics (the few who pay – with donations – make the service available to a whole community), Pledgebank (crowdsourcing makes entrepreneurial initiatives affordable to people without adequate personal funding), neighbourhood nurseries or wardens (few volunteers empower parents or take care of security of a given area), and so on.

3. The Social Option Matrix (SOM)

In the previous section a working definition of social innovation has been given and commented. Here, we address some aspects of social innovation that the literature has not so far fully covered: the driver of innovation, the involved actor/s, and the phase wherein such an involvement occurs.

3.1. Driver

The driver is the reason that urges the innovator to develop a social innovation.

It is a general belief that business innovation is profit-seeking, i.e. the final aim to innovate is to make money. Conversely, to generate a positive effect on society is not a primary target for business innovation and in fact only few of them reach this result (Pol and Ville, 2009). On the contrary, it seems that profit is not the key driver for social innovation. Nonetheless, there exist some borderline cases of social innovation (e.g. models of distance education) that have later moved into business (Mulgan, 2006). Indeed, Nicholls and Murdock (2011) suggest that social innovation may be a good business opportunity. According to Serrat (2010) the profit goal is not primary.

Based on the proposed definition, a genuine need seems to be the main driver of social innovation. Yet, other drivers cannot be neglected. For instance, as suggested by Mulgan (2006), technology enables certain social innovations (e.g. Timebanks would not be possible without an infrastructure to host the needed website). However one may not affirm that social innovations enabled by technology are similar to the so called technology-push innovations, which may well concern goods non associated with genuine needs. (Edwards-Schachter *et al.*, 2012).

According to Green and Vergragt (2002) and Kinder (2010), social and technological innovations should be combined, whereas Medvedeva (2012) reports that technological innovation is a consequence of social innovation. With respect to the link between social and technological innovations, Fink *et al.* (2013) find that disruptive technologies should be accompanied by social innovations to be more easily adopted by communities

3.2. Actor

The actor is the subject who develops the social innovation. Even though it seems that the role of future users or beneficiaries is prominent, other actors are involved in promoting, developing and adopting social innovation: for example, individuals, especially when they are “heroic, energetic and important” (Mulgan *et al.* 2007). For instance, Fundación Paraguaya (Maak and Stoetter, 2012), which promotes education and agriculture in Paraguay by making an extensive use of microfinance initiatives, was launched by a single man, Martin Burt.

In most cases, social innovations leverage on structured groups of individuals, such as movements, foundations, or organizations, which can have different natures (e.g.,

religious or political) and can promote or start social innovations in concert or separately (Westley and Antadze, 2010). Often, such groups pre-exist, in other cases they are ad-hoc established.

Another potential actor involved in social innovation is government. Typically, governmental agencies are characterized by low creativity, so giving a limited contribution to the idea generation; nonetheless, they have the means to socially innovate and design effective social innovation, they can usually afford huge investments, and are often in the position to “purchase” the innovative social program or products on behalf of a community.

Social innovations are affected by uncertainty and could imply a long period (sometime infinite) of negative revenues. For these reasons, the role played by charities, foundations, philanthropists, no profits, governments can be crucial. Social innovations are risky and they can, exactly as other innovations, easily fail (Mulgan, 2006). That is why governments and, in general, politics can and should intervene in the collective action and common vision needed to produce social value or to solve societal problems (Kooiman, 2003).

The recognition of the actors involved in social innovation can also be led from another point of view: many of the most successful innovators have learned to operate across sector boundaries, and innovation thrives best when there are effective alliances between small organisations and entrepreneurs (the ‘bees’, who are mobile, fast, and cross-pollinate) and big organisations (the ‘trees’ with roots, resilience, and size) which grow ideas to scale (Mulgan *et al.*, 2007). For instance, CEO of Danone Group and Muhammad Yunus, founder of Grameen Bank and later winner of the 2006 Nobel Peace Prize, discovered that their areas of expertise were complementary and then decided to create (in 2006) a joint venture called “Grameen Danone Foods”, as an attempt to contribute to the development of poor countries: the goal is to provide children with many of the key nutrients that are typically missing from their diet in rural Bangladesh, and run on a “no loss, no dividend” basis (Yunus *et al.*, 2010) with the aim of reducing poverty by creating business and employment opportunities for local people, given that raw materials, including milk needed for production, will be sourced locally.

Social innovation can definitely take place within government, within companies or within the non-profit sector (also known as the third sector), but it is increasingly seen to

happen most effectively in the space between the three sectors (Lundströma and Zhou, 2011).

3.3. Phase

As any innovation, social innovation occurs along three main phases: idea generation, development, and implementation (Damanpour, 1991). We believe that considering the phase, especially in connection with the actor/s, is useful to comprehend the concept of social innovation.

3.4. From the dimensions to the SOM

To characterize social innovations we adopt the above described dimensions: actor, driver, and phase. The three dimensions aims at addressing to different questions: Which are the actors involved in social innovation? Which driver motivate them? In which phase of the innovation process? The values which each dimension can assume are the following (Fig. 1):

- driver: need, profit, technology;
- actor: company, government, NBO/NGO (i.e. non-business/non-governmental organizations, e.g. charities, groups, and movements);
- phase: idea generation, development, implementation.

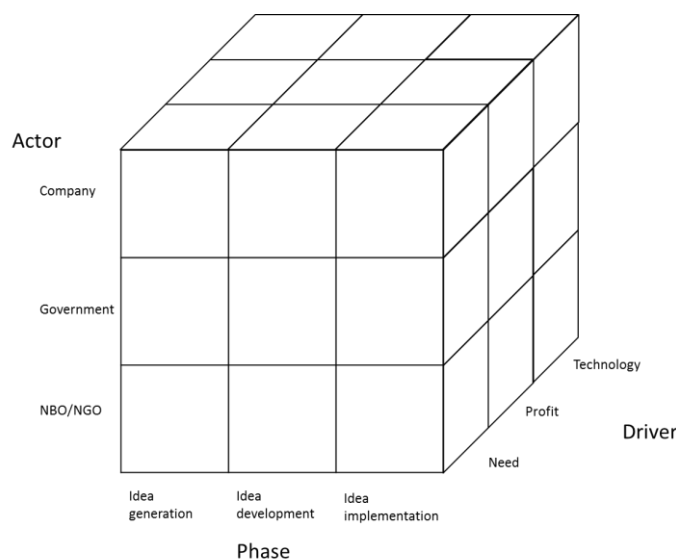

Figure 1 – The Social Option Matrix (SOM).

4. Application of the SOM to real cases

The literature reports several cases of social innovation, having different scopes and goals. Some of them relate to well-known problems with new approaches (e.g. Positive Deviance, Therapeutic Communities, Restorative Justice) or alternative solutions (e.g. Timebanking, Pledgebank), other ones aim at lowering the cost of services, especially in the field of healthcare (e.g. Aravind Eye Clinics, Lifespring Hospitals, Nrayama Health Hospitals), other put emphasis of particular aspects (e.g. slow-food, biological agriculture). We decide to use these cases to populate the matrix by characterizing the actors, the drivers, and the phase of the whole social innovation process. A similar approach has been proposed by Dangelico and Pontrandolfo (2010), using dimensions that are critical in the definition of green products.

For our research, we excluded those cases too broad or for which literature presents too weak descriptions that are not suitable to characterize them.

4.1. Fair trade movement

It is a form of commercial collaboration based on transparency, dialogue, and respect, finalized at selling products such as tea, coffee, cocoa, or craftsmanship. The origin of fair trade movement dates back to the early 1950s, when a religious group (Mennonite Center Committee) and a no-profit organization (SERRV International) developed supply chains in poor countries wherein trades were based on the principles of fairness and equity, instead of the common arm's lengths approaches. About one decade later, fair trade movement expanded in terms of both shops and no-profit organizations. The growth of the phenomenon came with the commercialization of the products with its own brands and labels.

4.2. Microcredit

Microcredit consists in granting very small loans (microloans) to poor borrowers, who typically lack collateral, steady employment and a verifiable credit history and therefore cannot access to traditional credit channels. Microcredit, which is based on the societal warranty on loans, is designed to support entrepreneurship and alleviate poverty, but also to empower women. It was born from Muhammad Yunus, a Bangladeshi economist awarded with the Nobel prize in 2006, who founded the Grameen Bank, a no-profit organization that then turned in a credit institute.

4.3. *Open Source Software*

The idea to make the source code of a software available to anyone so as to let them change or distribute it for any purpose dates back to the late 1970s, when some groups independently theorized that the access to the code and the freedom to redistribute and modify it are fundamental rights. So doing, these groups configured themselves as a real alternative to proprietary software systems. Nowadays, companies take advantage from this kind of innovation as they are kept abreast of technology development.

4.4. *Aravind Eye Clinics*

This is an alternative healthcare model, performed in developing countries in a large volume following a quasi-assembly line process. The goal is to provide eye care to patients, two thirds of which are treated for free. Dr. Venkataswamy acted as starter to solve this growing problem, using his own money at the beginning, and then he established the GOVEL Trust, a no-profit trust.

4.5. *Time Banking*

It can be considered a pattern of reciprocal service exchange that uses units of time as currency. Edgar Cahn started this practice and today it is articulated as charity constituted by volunteers. A UK no profit organization (Echo) provides infrastructure, free support and web solutions. It is financed by NESTA and delivered in partnership with London legacy Development Corporation (no-profit organization for the public sector).

4.6. *Pledgebank*

It is a website wherein everyone can post his/her own pledge which has the basic format "I'll do something if other people pledge to do the same thing". It was established in 2005 by a British charity called Mysociety.

4.7. *Slowfood*

It is a no-profit organization established in Italy 1989 to prevent disappearance of local food and preserve gastronomic traditions, and nowadays spread in several countries. Slowfood is promoted by NPOs and developed thanks to farmers and companies sharing the goal of opposing the standardization of taste and culture, and the unrestrained power of food industry multinationals and industrial agriculture.

4.8. Kindergarten

A kindergarten, also called neighbourhood nursery, is a pre-school educational approach addressed to childhood. The first British and probably globally infant school was opened in 1816 by a philosopher, Robert Owen, in conjunction with his venture for cooperative mills, to give education to his employees' children. Then, the idea was spread by Friedrich Frobel in 1837 with the opening of the kindergarten. Later, this free model turned into private solutions.

4.9. Skunk works

They are advanced or secret projects conducted by groups of people and concerning technology, aerospace, business, avoiding managerial or institutional constraints in order to create a radical innovation. The first project was realized by the company Lockheed Martin Corporation for the Advanced Development Program.

4.10. Which?

It is a brand name used by the Consumers' Association, a registered charity and a private company limited by guarantee (primarily a no profit organization) to promote informed consumers' choice in the purchase of goods and services and to raise the awareness of their rights. The Association owns several businesses (magazine, financial services, and so on).

4.11. Healthline Networks

It is a private owned provider of health information and technology solutions. The company, before known as YourDoctor.com, was founded in 1999 by Dr. Norman, an endocrine specialist and Internet health education pioneer and now it counts 21 millions of dollars in revenues.

4.12. Restorative justice

It is an approach to justice that focuses on the needs of the victims and the offenders, as well as the involved community: victims take an active role in the process while offenders are encouraged to take responsibility for their actions in order to repair and avoid future crimes. The idea was generated by an exponent of Mennonite Community, Howard Zehr, and then developed by NGOs.

4.13. Drug court

These are special courts that handle cases of non-violent criminals who abuse drugs under duress. They operate through a specialized model in which there is a strict application of the law but the mental health, social services, therapeutic communities and collective work are seen as a means to help nonviolent offenders find restoration in recovery and become productive citizens.

4.14. Community court

It is a neighbourhood-focused court that applies a problem-solving approach to local crime and safety concerns, emphasizing collaboration, crime prevention, and improved outcomes. It was set in the 1990s as a partnership between private organizations, state and local enforcement, and justice departments. For example, in New York they are successfully integrated into the larger court system.

4.15. Positive deviance

It is an asset-based problem-solving and community-driven approach to behavioural and social change based on the observation that in any community there are people whose uncommon but successful behaviours or strategies enable them to find better solutions to a problem than their peers, with no extra resources or knowledge. The approach was first operationalized by Jeff and Monique Stermin through their work with Save The Children, and then adopted by several organizations.

4.16. Therapeutic Community

It is a participative, cohesive, group-based approach to long-term mental illness, personality disorders and drug addiction: patients have a significant involvement in decision-making and the goal is to avoid unhelpful dependency on professionals in order to enhance collective responsibility and empowerment. With its roots in various religious and political movements, the first community arose thanks to the doctor Maxwell Jones. Some of these realities are also integrated in NHS.

4.17. Participatory budgeting models

It is a process of democratic deliberation and decision making in which ordinary people decide how to allocate part of the municipal or public budget. The first fully

participatory budgeting process was developed in Brazil, in Porto Alegre, starting from an innovative reform program, and later the model has been adopted all over the world.

4.18. *Charity shops*

It is a retail establishment run by a charitable organization to raise money; it is a kind of social enterprise which uses goods donated by members of the public and staffed by volunteers. The first one was set up by a centre for blinds. The widespread came later with the Red Cross.

4.19. *Lifespring Hospitals*

It is an expanding chain of maternity hospitals established in 2005 to provide high-quality health care to lower-income women and children in India through affordable rates. It is a joint venture between a no-profit global venture philanthropic fund and Government of India - owned corporation, a manufacturer of condoms.

4.20. *Nrayama Health Hospitals*

It is a multi-speciality low-cost and high-quality hospital chain in India. The doctor who promoted the initiative, Dr. Shetty, is supported by the Asian Heart Foundation and the Indian Space Research Organization. Approximately one third of the patients do not pay out of pocket.

4.21. *Grameen Danone*

It is a local business enterprise launched in 2006 to provide children with many of the key nutrients normally missing in the diet of rural Bangladesh, through the creation of very nutrient yogurt. It is run on 'no loss, no dividend' basis. At the beginning 1% of revenues was divided with shareholders, but since 2009 the board decided to waive any monetary return.

4.22. *Distance learning*

It is a model of delivering education and instruction to students which are not physically present in the traditional setting like a classroom. The first education course of shorthand was provided by Sir Isaac Pitman in the 1840s; three years later the

Phonographic Correspondence Society was founded to establish formal courses. The spread happened through Universities and Colleges and by Internet at the end.

4.23. *World Wide Web*

It is the well-known system of interlinked hypertext documents accessed via Internet with a web browser. The 1.1. World Wide Web was developed by a CERN employee and computer scientist in 1989 to achieve an effective communication system within the CERN. The CERN is an European Research Organization.

4.24. *Magazines sold by homeless*

So called street papers are newspapers or magazines sold by homeless or poor individuals and produced to support and cover them. Street News, for example, was founded in 1989 by a rock musician and it gained donations for the advertisement. There are also other cases like The Big Issue, The War Cry, linked to a religious and charitable organization.

4.25. *Biological agriculture*

It is about looking at the whole agronomic, environmental picture, nutritional, and biological components of what constitutes a healthy soil.

5. Discussion and implications

In the above Section we positioned different real cases within the proposed matrix and discussed which actors intervene, why, and when.

With respect to the actor dimension, in the analysed cases NBO/NGO are more involved in social innovation than governments or companies. Moreover, while the former are involved in all the phases (Fig. 3), the involvement of companies and government tends to increase moving from the idea generation to its development and implementation (Figg. 2 and 4). This seems to suggest that the pattern is essential in generating, developing, and implementing this kind of innovations.

In most cases, social innovations are need driven, conversely, the technology driver is quite rare. When the latter is relevant, it concerns companies (Fig. 2), whereas it is negligible for groups and organizations (Fig. 3) and absent for governments (Fig. 4).

Actor: Company

Driver	Technology	2	4	5
	Profit	1	1	4
	Need	5	8	9
		Idea Generation	Idea Development	Idea Implementation
		Phase		

Figure 2 – The SOM for the company.

Actor: NBO/NGO

Driver	Technology	1	1	2
	Profit	0	0	0
	Need	22	21	20
		Idea Generation	Idea Development	Idea Implementation
		Phase		

Figure 3 – The SOM for NBO/NGO.

Actor: Government

Driver	Technology	0	0	0
	Profit	0	0	0
	Need	2	3	4
		Idea Generation	Idea Development	Idea Implementation
		Phase		

Figure 4 – The SOM for the government.

With respect to the phase dimension, in the majority of cases the idea generation involves NBO/NGO, whereas companies and governments are seldom involved (Fig. 5). Also in the idea development, the role of companies and governments, although increasing, remains low (Fig. 6). During the idea implementation, the number of involved companies grows, but the majority of cases still refers to groups and organizations (Fig. 7).

Phase: idea generation

Technology	1	0	2
Profit	0	0	1
Need	22	2	5
	NBO/NGO	Government	Company
	Actor		

Phase: idea development

Technology	1	0	4
Profit	0	0	1
Need	21	3	8
	NBO/NGO	Government	Company
	Actor		

Figure 5 – The SOM for the idea generation. **Figure 6** – The SOM for the idea development.

Phase: idea implementation

Technology	2	0	5
Profit	0	0	4
Need	20	4	9
	NBO/NGO	Government	Company
	Actor		

Figure 7 – The SOM for the idea implementation

During the idea generation and, to a less extent, during its development, need driven social innovations are largely prevailing (Fig. 5 and 6); also during the idea implementation, the majority of cases are need driven, but technology driven social innovation count several occurrences, too (Fig. 7).

Finally, the analysis can be carried out under the perspective of drivers. It emerges that, regardless the developer and the phase, need is the most frequent driver (Fig. 8). Technology plays a limited role, which tends to be relevant only when the driver need is less important. Specifically, technology is a driver only for companies (in all the phases), as well as for groups and organizations (in the implementation phase only) (Fig. 9). Of course, profit (Fig. 10) drives only companies, especially in the phase of implementation, when profit is more likely given as the innovation is more mature and less risky.

		Driver: need		
		Idea Generation	Idea Development	Idea Implementation
Actor	Company	5	8	9
	Government	2	3	4
	NBO/NGO	22	21	20

		Driver: technology		
		Idea Generation	Idea Development	Idea Implementation
Actor	Company	2	4	5
	Government	0	0	0
	NBO/NGO	1	1	2

		Driver: profit		
		Idea Generation	Idea Development	Idea Implementation
Actor	Company	1	1	4
	Government	0	0	0
	NBO/NGO	0	0	0

Figure 10 – The SOM for profit as driver.

In addition, we can focus on the role of business, and note that different categories of social innovations emerge, each characterized by a diverse business model: in some cases, companies are not involved at all (see for example at the Pledge Bank) or are present for philanthropic reasons only (Grameen Danone); in other cases the social innovation allows a profit to be obtained, though low. Moreover, in some cases the role of companies is substantial as they are the weak category to which that social innovation is addressed (e.g. skunk works), in other cases their role is subordinate (e.g. in Aravind Eye Clinics the companies provide the lenses), finally there are further cases in which the companies limit their role to business, making profit from the product or service (e.g. selling products from the fair trade or the biological agriculture).

6. Conclusions

In this paper, an innovative tool to characterize social innovations has been proposed. Moving from the literature review, we have adopted a compact working definition of social innovation (SI) based on the literature review and, observing that there is no clear agreement by researchers on some features of SI (which then we kept out of the adopted definition), we have used them to build the Social Option Matrix (SOM). The latter is a multi-dimensional matrix aimed at investigating which actors intervene in the social innovation process, in which phase, and according to which driver.

Each cell of the SOM, represents a possible combination of the values assumed by the above dimensions. Then, we have populated the SOM with 25 real instances of social innovations derived from the literature. The analysis has shown that, relatively to our sample, in all the phases of social innovation groups and non-business/non-governmental organizations are more involved than governments or companies; the involvement of companies and government, however, tends to increase moving from the idea generation to its development and implementation. The analysis of the selected case has also confirmed that social innovations are mostly need driven: the technology driver, indeed, is quite rare whereas the profit driver pertains to companies only, and occur mostly in the last phase of idea implementation.

The actors involved in the development of social innovations can adopt the SOM to better understand what a social innovation is as well as to increase their awareness on what they (can) do with respect to social innovation: for example, governments could pick the opportunity up to enter in this field and to provide means to achieve social innovations; companies could allocate themselves in the matrix to improve their communication towards stakeholders.

We are also aware of some limitations of this analysis. In particular, given the quite high number of the analysed cases, it has not been possible to carry out an in-depth investigation for each of them. Nonetheless, we think that the adopted approach has been effective as a starting point to explore the role of companies in social innovation and which are the drivers to get them involved. Based on our preliminary results, some implications can be derived for companies, which concern when and why they should participate to social innovation initiatives, and whether some strategic alliances could be convenient to achieve a broader goal.

How to facilitate social innovation? The “Innopresence-method” as a tool towards sustainability

Structured Abstract

Purpose – This study will introduce the new practice-based method of facilitation which may be useful in the battlefield of misunderstandings, preconceptions, and outdated attitudes of working life, but also as a fruitful tool towards social innovation. The seed for the birth of Innopresence-method came from the practice-based experience of organizational working life – from the workers’ experiences of presence.

Design/methodology/approach – The Innopresence is based on the collected data of the (social) innovation development work executed in Finland during the years 2011 – 2014 with the help of 277 worker’s experiences. The qualitative, phenomenological analysed study submits that the most important part of facilitation is to make people open enough to share their practical and tacit knowledge in a common space, in the *ba of equality*, which could be seen as a place of open dialogue where everybody is treated equally.

Originality/value –Social innovation may be seen as a process where a new solution is found for a problem by considering it from a new point of view by for example developing ‘common spaces of sharing’ together equally with everybody in the community - where participants of dialogue are valuable resources of knowledge and (social) innovation (Heikkilä & Heikkilä, 2001). These spaces of sharing seem to be an important part of social innovation -these ‘*bas*’ (arenas for social interaction; Pässilä, Uotila & Melkas, 2013) *of equality* are the “seedcases” and significant constituents of new (social and sustainable) innovations.

Practical implications – The outcomes of the application of the creation process and use of Innopresence-method has showed that there is a need for common spaces of sharing in the field of Finnish working life. Through the emerging themes of experiences it appears that together built and shared spaces have helped employees to change their thinking models of daily work towards more sustainable and innovative ways to develop it – and create new kind of social innovations. Workers in organizational playgrounds should have time and space to share concrete experiences of their work to develop new, socially sustainably ideas and innovations.

Keywords – facilitation method, social innovation, innovation, interaction, presence

Paper type – Academic Research Paper

1 Introduction

Social innovation is a counterpart of technological and scientific innovation. Already Schumpeter identified social innovation that should take place in economical arena as well as culture, politics and society's way of life in order to guarantee the economic efficacy of technical innovations (Howaldt & Schwarz, 2010). In management studies and in innovation research, innovation is often seen as technological and scientific progress. Therefore Mumford (2002) called social innovation a lost domain in innovation studies.

Social innovation is described for example as a broader umbrella concept that includes ideas of social entrepreneurship (Weber, 2012). Social innovation is nowadays also seen to be closely associated with interorganizational and intersectoral collaboration which finds alternative solutions to some of the most intractable social problem in our world. Both social innovation and social entrepreneurship are about new and innovative ways of organizing, collaborating, and managing that influence actual practices and technologies. (Lawrence, Phillips, and Tracey, 2012.)

The birth of social innovation is linked to the human ability of interact, work, develop and innovate together with others (Centre for Social Innovation 2010) and the changing of the ways of thinking that increase novel solutions to social problems with societal value (e.g. Phills et al. 2008; Ståhle et al. 2004) or new ideas that work in meeting social goals (Mulgan et al. 2007). Many important social innovations have developed through workers' daily practice-based development work inside the organizations. Development of social innovation is connected to the interaction of the people inside an organization - and the participatory processes are important parts of it. Social innovation of working life could be a new idea created by an individual or group of communities; it brings, for example, added value in the wellbeing of individuals in the organization (Taipale & Hämäläinen, 2007).

One key tool of interaction in an organization is the worker's ability to be present – with a workmate, with a customer or attending to his or her own work. But nowadays there is a lack presence due to the stress of everyday life. People are in rush to 'already-be' in the next moment, next place, next project, and almost the "next life". More fast you are the more effective you are, even if that you do not know what for you are running and rushing. Faster and faster.....fast food, fast everything, you have to answer to your e-mail, this offer or phone immediately, now! Before somebody else do that earlier. When society pressures workers to increase effectiveness and ability of competence it occupies

their process of thought which makes people lose their way to be present in their work – and evaluation of it. All the anterior observations were very common among the workers who were an important part of this research.

A worker's individual capacity of being present in a moment has not been researched thoroughly. The experience of presence belongs to the field of tacit knowledge, which is – because of its 'invisible character' – a challenging field to study. Also perception and bodily awareness have important roles in tacit knowledge (Parviainen, 1998). Otto Scharmer's "Theory U" (Leading from the Future as It Emerges, The Social Technology of Presencing, 2009) is one of the previous organizational management studies which highlight the meaning of the experience of presence as a learning factor in organizations, work teams and in the field of leadership.

This study attempts to tackle two research questions: How the experience of presence can be facilitated in organisations? And the second question is what the experiences of presence in organisations are? With the guidance of these questions and their relationships to more sustainable way of innovation this study will introduce a new facilitation method that builds on social innovation and Scharmer's concept of 'presence'. This paper is constructed as follows: first, the theoretical foundations are presented. The empirical part of this paper introduces the method and empirical observations that were obtain from testing the method in organisations.

3 The researched phenomenon: Presence

The phenomenon of 'presence', 'the state of condition of being present' (by the Illustrated Oxford Dictionary 1998) has not been researched extensively. Presence is described as being the moment when one no longer waits for the following moment to fulfil this current one (Tolle, 2002), or as being a state which is not analysed but experienced as immeasurable and endless (Beck, 2007). Presence makes every moment appear constantly new, reorganises itself and changes individual denotations of phenomena (Varto, 2011).

In this article, the concept of 'presencing' is used to signify a combination of sensing and being present, that is according to Scharmer being "connected with the source of the highest future possibility and bringing it into the now" (Scharmer, 2009), or a flexible state of mind (mindfulness), in which people are actively engaged in the present and notice new things (Langer, 2000). The challenging part of presence is that it is situated

outside the text in the past experiences; you can only write about it when it is not there anymore (Bäck, 1995).

3.1 Scharmer's new social technology as a tool towards more sustainable innovations

Otto Scharmer has worked with many governments in Africa, Asia, and Europe and has innovated award-winning leadership programs for companies (including for example Daimler, Fujitsu, Google, and Natura) (Gunnlaugson, Baron, and Cayer, 2014). He focuses on a holistic, “new” way of understanding which means that mankind needs to take into consideration wider perspectives, such as common values that uphold all living on our planet in order to cope. The holistic attitude relates to the way of life where goal is to achieve sustainable development in every dimensions of organizational living. It is necessary to change technological and organizational thinking because of the global environmental and social threats (climate change, hunger, pollution etc.) that humanity and the Earth are facing. (Lähde, 2004; Macy, 2007; Scharmer, 2009; Sveiby & Skuthorpe, 2007.) Scharmer helps groups of diverse stakeholders from business, government, and civil society to innovate at the level of the whole system using his Theory U and presencing as a landmark. He wants to help people gain access to and learn to work from the deeper levels of knowing and being. He thinks that “*what can save business and society already exist, but we need to attend to it more mindfully*”, and that is what he tries to do with Theory U and presencing. (Gunnlaugson, Baron, and Cayer, 2014.)

One important part of this ‘to be present’ -attitude is spirituality, which can be said to be another word for personal awareness (Fairholm & Fairholm, 2009) and an element of creativity and that is the reason why for example, Scharmer recommends silencing the mind to be incorporated in leadership training (Scharmer, 2009). Today’s organizational leadership needs a new type of social technology based on three instruments which everybody already has – an open mind, an open heart and open will. Refining these capacities from the individual level towards a collective level leads to new technology. (Scharmer, 2009.)

In the experiences of presence, these three capacities are linked. The first one, the open mind, is based on the ability to access the intelligence to see with fresh eyes. The second instrument, the open heart, relates to the ability to access emotional intelligence, the capacity to feel empathy. The third is open will, which relates to the ability to access

one's authentic purpose and self. This "three-type of intelligence" is also referred to as spiritual intelligence, as a moment when something "new" can emerge changing the quality of our attention by letting go of old identities and intentions and allowing some emerging future purpose to enter your life. (Scharmer, 2009.)

Social innovations are introduced for example by an entrepreneurial spirit and through solidarity; they may improve the functioning of the organisation or to transform the organisation into a social enterprise, an enterprise with social objectives or to empower it with a more participatory governance system (Nussbaumer & Moulaert, 2007). During recent years, the subject of sustainability has slowly aroused more interest for example through an ecological view of organizations (Harle, 2007). It has been noted that modern society requires a social consciousness and global ecological responsibility as well as a new focus for innovation (Sveiby & Skuthorpe, 2006). John Dewey argues in his philosophy of experience that the most sustainable results of frugal operation will obtain then, when all the participants/workers of the action give their most free and creative parts of them, and when they work in an open, reciprocal interaction (Alhanen, 2013).

In this research the place, where to accept our experience and make it reality is a "deeper place of stillness where it is easy to let go of the old and connect with higher-order intentions" (Scharmer, 2009), the place called "presence", may be seen as a place or space for a new, more open interaction, the possible to develop a more sustainable social innovation.

2 Methodology

2.1 Phenomenological approach

The investigation is qualitative, because all the data of people's experiences is collected and analysed through the phenomenological thematic analysis. The experience of 'presence' is a special state of awareness where we find ourselves in the realm of presencing and learn to sense the future that is seeking to emerge (Scharmer, 2009) connected to the phenomenological conception of silence and particularly to the exercise of silence which slows us down to be present with that something which is shining through itself despite of our will and representations (Varto, 2011). The moments of presence can be seen as the moments of collective awakening which may lead to the consequent changes in social systems (Senge, Scharmer, Jarowsky, and Flower, 2004).

This study is an experience-based try to verbalize the more or less silent and hidden parts of the certain phenomenon – the presence – in human existence. In order to understand a phenomenon in research and describe its essence – the essence of the experiences of presence – we have to understand ‘the nature’ of our experiences in a phenomenological way problematizing what we experience but take for granted that what we see is what it seems to be. This is the reason why phenomenological approach was selected. This means that the researcher (and a facilitator) is “actively waiting” for the phenomenon, and its meaning(s), to show itself, even if it is never finally completely explored or described (Dahlber, 2006).

The data of this study has collected through 23 workshops, where the researcher (first author of this paper) has been not only as a researcher, but as a (social innovation) facilitator trying to be the activator-link between the participants and their inner activity being sensitive and respective to their original descriptions (of presence), the phenomenon, and its open horizons. Phenomenological approach offers a suitable way of processing for the experiences of tacit knowledge, to learn about human experience, to open for it, and real understanding of phenomenology can only be accomplished by “actively doing it” (Van Manen,1990).

2.2. Data

All the data of this paper has collected in Finland during the years 2011 – 2014 in various (social) innovation development workshops mostly in the fields of public sector (elderly care, dental care, public health, and youth work). The amounts of the workshops (23) and participants (243) are viewed in the next Table 1.

Table 1. Collected data 2011 – 2014

F= women, M = men

Workshops:	where	organization	when	amount	participants
1. Workers of elderly care	Lahti	Public sector	2011	2	44F
2. Workers of dental care	Lahti	Public sector	2011-2012	8	30F, 2 M = 32
3. Workers of child welfare	Tampere	Public sector	2011-2012	7	13F
4. Theatre sessions for workers of public health	Lahti	Public sector	2011	2	84
5. Participants/interns of theatre workshop	Tampere	3. sector – employment	2011-2012	2	14F, 12M = 26
6. Youth workers	Kuo-pio	Public sector	2013	1	14F, 6M =

					20
7. Adult education	Lahti	University	2014	1	23F, 1M = 24

The main themes of following workshops (including two theatre sessions) have been customer oriented approach and (social) innovation, and the ability to be present in your life and work, especially when you encounter another person (for example a customer, client, and colleague). All the experiences of presence of this paper have been collected in many participatory ways by using art-, contemplation- and body –based tools in workshop work (see Table 1.), but also by having three deep interview, and collected self-written narratives (31). The amount of people who have been participated this research is hence 277.

The dissection of the whole data is still preliminary and needs more exact processing and analysis, consequently all the results of this paper are directional.

4 Innopresence-method

4.1 Innopresence-method as way of working

Table 2. presents a typical way of facilitate the Innopresence-workshop. Even if the way of facilitating is different in every time because of many things (the tasks, the atmosphere, the level of energy, the place, and so on.), here it is seen some common, and also the most important, features of it.

Table 2. Some typical way of facilitate Innopresence-method in workshop working

1. Warming up – > free movement in space, gently awaking body and senses, finding a new perspective to move your body
2. Finding own space and body position in a room > Why did you pick that position? <i>“I can see outside...---... the sky is a beautiful element: stars, sun, moving clouds, there’s still light in middle of gray sky...---...At this moment I have some pain in my back, I get this movement from the movements of the clouds...”</i> > getting to know each other from a new point of view
3. Changing places: a chance to go through all the places and positions – “jumping into another’s shoes”
4. Observations of the movement exercise in the “round floor discussion” (f.e. sitting on the floor in the circle)
5. How has the subject of presence been in your thoughts at your work? Talking in groups/pairs, sharing experiences.

6. “Common space of sharing” > Sharing the found experiences by talking together in a bigger group – in equal, all participants together. > In this part the role of facilitator is to be very alert to hear all the important insights people have shared about their experiences
7. What was the ‘main theme’ of the discussion? What is now the most important task we should take care in our work (organization)? > The first part of the workshop may end with a discussion about the emerged ‘main theme’. In some cases the discussion may be a start to a new (social) innovation.
8. The next part of workshop is possible to facilitate inside or outside. In this example it happens outside in a large park nearby the place where people are working. This part is called ‘silencing your mind and contemplating nature’.
9. Find yourself a nice place to be at one with yourself. Try to it in unique way, for example by just “hanging around”. Think about your subjective relationship to nature.
10. When you’re in your place, clear your thoughts by silencing your mind. Be aware, observe and sense all around you. If you feel comfortable enough, let one issue from work (the one you maybe have been worried about lately/some task from the last discussion together) to come to your mind. Accept it and let the answer come from this situation, from nature, from yourself.
11. Coming back together and sharing the thoughts and insights. This is much alike than parts 6. and 7. before.

4.2 Experiences of presence – and some effects of them

In the start of creating a new facilitation method the main interest was in the experiences of presence: What were they like? Where they used to happen? The first characteristic and repeated observation in the creation process of Innopresence after the first workshops and interviews was, that the most important place for the experiences of presence seemed to be somewhere in nature.

“When I am in nature and experience those moments, the world is not ‘somewhere far away’, instead it comes to me. I would not say that I am a part of nature or the universe or anything else, but I feel at home during those moments.” (Man, 37 years, Project Manager)

Many participants have found the nature-exercises (/their own nature-experiences) easy to do because it is ‘so normal’ to Finnish people to go outside to nature almost every day. Scharmer finds similarities between aboriginals and Finns in the concept of power-places, “*simple cabins in the woods*” and heartfelt relationship with nature, which children are encouraged to develop and parents teach their children to listen to the forest. This kind of relationship with the presence of places in nature is special, even sacred, and it may have contributed to Finnish children excelling at school and the many successful social and technological innovations in Finland (Scharmer, 2009). Biomimicry also testifies how nature is full of all kinds of innovations and that is why the future belongs to

the “nature-smart” people who develop a deeper understanding of the transformative power of the natural world (Louv, 2011).

Some people found that experiences in nature for example help to “let go”, “surrender” and “connect to your real family (Nature) who is always present”. People sensed feelings of peace, flow and positive thoughts (projecting to the future, towards a challenging meeting in the following week). According to international studies, the power of nature and connection with the natural world are fundamental for human health, intelligence, well-being, spirituality and survival (Louv, 2011; Frumkin, 2001), and observations of nature can evoke a sense of spirituality (Louv, 2009) and a desire to protect the environment (Chawla, 2007).

Another interesting ‘sustainable’ result after various experiences with Innopresence-method was that the most common word people used when they described their experiences of presence was ‘connection’, but their connections were different. There were many main characteristics with different emphasis: feeling of connection, connection with nature, connection with another person (client, customer, colleague, friend, and so on), connection with harmony and stillness/empty mind / flow (intensive action, strict observation of little details), and connection with something bigger than oneself. We may easily see that all these experiences are seen to belong to the holistic attitude of creativity (Scharmer, 2009; Sveiby & Skuthorpe, 2007) which lies in the flux between harmony and conflict and connecting with it enables us to reconnect with the innate human impulse for creation and evolution, the flow that makes change possible (Halprin, 2005). Modern quantum physics teaches us that all living creatures and elements are connected. Mankind depends on its relationship with the environment (synergy) which is why we now face many global challenges (climate change, hunger, pollution, economic crisis etc.) and we need to change our outdated technological and organisational thinking in relation to planet Earth and all life forms on it (Lähde, 2004, Macy 2009, Scharmer, 2009 and Sveiby & Skuthorpe, 2006).

Common for all the observations of ability to be present at work (and life) were that they have been shared together in the *ba of equality* (Nonaka & Takeuchi, 1995) which could be seen as a place of open dialogue or a certain space where everybody is connected to each other – and treated and listened equally without any status or hierarchies. In that way the all participants of dialogue may be the valuable resources of knowledge and (social) innovation (Heikkilä & Heikkilä, 2001).

The participants/workers of the organizations achieved many practical changes after creating (processing) and using the Innopresence method. For example in one organization of child welfare and in the dental health care the workers had noticed that the consciousness about their own processes and attitudes had increased, they were more aware of it. They had started to pay more attention to their resources, and how to develop hope both within their client relations and within the relations towards themselves. *“This work is never ready. You rarely get positive feedback; you must also have to give it to yourself.”* (Woman, 59 years, Social Worker)

Many participants of the whole Innopresence-process described in their feedback that they learned to pay attention to the strength of positive thinking (and observation) and to things which disturb their ability of presence. They found ways to be calm in middle of a rush, possibilities to recognize and become aware of their working methods and a way to develop their work and themselves as workers. They awoke their consciousness of the importance of presence. These all are important aspects if we think about more sustainable way of innovate, and develop social innovations. But it needs vigilance and self-discipline to change one’s thinking routines and break the formality of work towards a collective creativity. Collective creativity requires courage to have an open and safety surroundings to act differently (Frantsi, Pässilä and Parjanen, 2008; Parjanen, 2012). Breaking our daily routines by seeing things from more than one perspective (Parjanen, 2012) and by trusting senses may open up to the world around us (Thorsted, 2008; Scharmer, 2009). The creativity contains also co-operation and service without competition – but with co-operation and symbioses (Lecture notes of the Neijing Dance Seminar, 2012).

When workers who had participated in Innopresence creation process -workshops evaluated themselves, they were assessing what they already knew, did not know, and what they would like to know recognizing their own strengths and weaknesses. They became more familiar with their own beliefs, and possibly their misconceptions and cynicism. They were able to set goals that they felt they could attain with the new knowledge they had gathered about themselves. Insights inside the group and workshops were bettering the quality of their work and giving more tools to develop it. The shared awareness of presence seems to also to be strongly connected to the wellbeing at work: *“Presence means that you know yourself as a worker, too; what are your strengths, and in what areas you still need to develop. This way you may benefit from your own resources*

as a worker and not burn yourself out. The presence has a big influence on the work community. Presence affects wellbeing and the structures of the (work) community.”
 (Woman, 35 years, Social Worker)

It seemed that workers’ experiences of presence are related to innovativeness, shift and development of the organization, and it is possible to use experiences of presence also as one’s key tools for the evaluating of her/his own work. But we have to build spaces, places, possibilities and time in organizations to do that intentionally. The “common space of sharing” is not so common and usual thing in the working cultures. Indeed we have lots of team-, week- and management –meetings, but we do not have the intentional and facilitated space for common and equal/non-hierarchical sharing the experiences of work.

4.3 Innopresence and Scharmer

The following table (Table 3.) displays certain similarities between Scharmer’s three key instruments to use the new type of social technology (open mind, open heart and open will) and the Innopresence-method.

Table 3.

Scharmer’s three instruments of social technology to use in organizational development work

(Scharmer, 2009)

Open mind

A fresh look

Perceiving objects and facts

Open heart

Connection with surroundings

Tuning in to different contexts

Empathy towards other

Empathy listening

The parts of Innopresence

1. Warming up –> free movement in space, gently awaking body and senses. Finding a new perspective

2. Finding one’s own space and body position in a place: “---... *when being alone by myself, I do not control my thoughts or what I say to myself. It is easier to drift to a situation and a state of mind where something grabs my attention, empties my mind of all thoughts and I no longer see my surroundings the way they are.*” (Man, 45 years, Stage Worker)

3. Changing places: a chance to go through all the places and positions – “jumping into another’s shoes” – empathy listening of another person

8.9. ja 10. ‘Silencing your mind and contemplating nature’ – empathy listening of nature and your inner voice: “*to be at peace and silence with yourself*”, “*to be authentic, to be who you are*”, “*reciprocal interaction*”/“*listening and hearing*”, “*concentrating on one thing and moment at a time*”, “*identifying your*

own emotions” and “emphasizing another person’s emotions”.

Open will

Letting go and letting come

The place of ‘presencing’ which connects open mind, open heart and open will

Cannot be described with words

Authentic purpose and self

“I can’t express what I experience in words. My whole being has slowed down. I feel more quiet and present and more my real self. I am connected to something larger than myself.” (Scharmer 2009, 12)

5., 6., 7. and 11. The sharing parts of Innopresence when people share their experiences in pairs, groups, or altogether. This is called ‘the common space of sharing’ where everybody is listened equally. It may also be a moment of inner insight or idea, which is sometimes even difficult to share because of its ‘tacit nature’: *“Actually words cannot describe my experience; I do not believe that there is any way to describe that moment...---... I believe that the moment of presence is the moment when that mind awakens.”* (Man, 35 years, Project Manager)

There were seen also many strong similarities between the workers’ descriptions of experiences of presence and Scharmer’ three main instruments of new social technology (*open mind, open heart and open will*). People even used same words when they describe their sensations: ‘open mind’, ‘open heart’, ‘authentic self’ and ‘letting go’ were common expressions. Some of the workers/participant were also very conscious about their “blind spots”, the place within us where our intention originates (Scharmer, 2009) for example during customer meetings.

In Innopresence workshop processes, through the equal encounter between participants and the group field, there was born a collective, a common space of sharing, coming into presence both in silence (feelings, images, and body awareness), in art-based expressions (authentic movement, improvisation) and in language (shared words and thoughts), opening the way for new meaning and discoveries to be discovered. Olen Gunnlaugson, who has researched collective wisdom and leadership development writes about that kind of encounter between participants and the group field, that: *“Such shifts have the potential to shift the conversation in the direction of presencing or greater collective intelligence, increasing the collective process and quality of attention, with the proof of discernment being its knowledge and lifetransforming fruits (increased presence, clarity, acuity of thinking, feeling, etc.)* (Gunnlaugson, 2011, 16)”.

If a person gets in touch with his or her inner spiritual being (awareness of presence), it enables him or her to identify and use his or her best qualities, such as, confidence,

quickness, courage, perseverance, hope, and love, and help leaders to motivate, inspire and to intensify the unity of the group (Fairholm & Fairholm, 2009; Scharmer, 2009).

6 Conclusion and discussion

“I have been more present by myself; I am more aware of my body, senses, attitudes and emotions....---...What could this mean in working life?” (Woman, 37 years, Social Worker)

Innopresence-method provides a very different approach to more rationalist approaches such as commonly used ideation techniques. The use and research of Innopresence and all same kind of methods of experiences of presence (meditation, mindfulness, and so on) in work organizations is challenging today because of the demand for productivity and rationality. Productivity requires performance and constantly fastened routines but a common space of sharing requires time, presence, ability to stay still and share together in the present moment. But it is not the only challenge of this phenomenon of presence, which is difficult to research because of its ‘invisible nature’. Already in 1996 when Otto Scharmer did his first interview with Francisco Varela, Varela said: *“I maintain that there is an irreducible core to the quality of experience that needs to be explored with a method. In other words, the problem is not that we don’t know enough about the brain or about biology, the problem is that we don’t know enough about experience....”* (Scharmer, 2000).

The phenomenon of presence is subjective, dynamic and based on one’s own experience, but there is still seen various amount of similarities in the descriptions of participants. One common perception was that the more you pay attention to your presence the more your awareness of it increases. People who are working in organizations are not separated from their ‘outer lives’ or civil lives – their ways of thinking, feeling and acting. Their ways of work and live are connected in the same lively way like they are connected to the nature. Through the experiences of Innopresence process it seems that there is still some aboriginal inside the western individual, an urban “aboriginal” who wants to shift his way of living towards more sustainable, and connected way of living and working? What needs to be done to reawaken it?

It is very common nowadays that interaction, crucial element of any knowledge transfer activity, inside organizations does not function well enough because of stress,

communication silos between people and their levels of acts, thoughts and emotions in the working communities which are not relevant in the building process of social innovation.

What would happen if working groups could coalesce and share their ideas without being censored by hierarchical interventions? Maybe the capacity for dynamism in the workplace could change for a more sustainable, even limitless direction. Almost all the 277 workers who were participated in the creation of the Innopresence in a way or another wished that they could have more daily 'common space' to share intentionally their experiences at work. The kind of shared 'presence-awareness' could possibly be a fruitful way of thinking and acting for work organizations who want their workers to participate in the development of their work - and increase the ability of creating more sustainable and social innovations, as well. But it is obvious that much more future research and more exact analyzes of the data is needed.

Abstract

In last years there has been a change in the choice of tourist destinations due to a grow of alternative forms of hospitality. In fact new generation of tourists shows a certain impatience with standardized holiday and starts searching for most authentic products reflecting the culture of the place. The success of these new tourist practices manifests the cultural change that has affected all aspects of today's society, moving from the sphere of values, finds expression in behaviour and consumption patterns. In fact the new generation of tourists shows a certain impatience with products of the standardized and comprehensive holiday, and starts searching for most authentic products which are closer to the culture of place. In Basilicata a project promoted by the Gal Cosvel (Group of local action, Consortium for the development of the local economy), supported AD because is a sustainable formula and doesn't modify in some way the territorial order and encourage to reuse of the existing patrimony.

Keywords – Tourism, Sustainability, Widespread hotel, Organization

1 Sustainability and new Tourism demand

In this context, rural tourism as a form of tourism that respect the environment, is becoming increasingly desirable for the preservation and enhancement of environment and local communities. Rural tourism must be understood in the reception in rural areas which provides the ability to perform specific activities (cycling, fishing, horse riding, country life and healthy) and stay on farms with activities related to them. Looking at the size of fruition ", there is a rural tourism when tourists visit different places from everyday life in areas with low population density, a primarily agricultural and economic condition in the presence of traditional social structures; basic motivations are looking for

peace and tranquillity, expectations of scenarios and the provision for social contact with a human dimension" So there are important sociological factors that determine the desire for uniqueness and authenticity. Policies to promote local quality products therefore meet the growing need for safety and quality: the naturalness and authenticity of typical products are the new shelter that goes beyond the city gates, and can not be " out of town ". The authenticity implies by involved actors, a work of reinvention and reinterpretation of the past : we see the use of procedures of certifications, formal and informal , which tend to justify the originality of a given product recalling its conformity to tradition , local cultures and identity of the place. To better define the uniqueness of a product , the European Union has created a regulatory system of food production that , through forms of labelling or certification of quality, as the definition , protection and preservation of the identity of the products identified in the marks . Tourists of today love the small villages, local cuisine, explore the traditions and customs of local communities, the warm reception and ultimately show a growing demand for quality, the search for authenticity and lifestyles and emotions typical of villages and communities. The selection of a positioning through this kind of hospitality, may be able to put in value the relevant public and private real estate capital renovated with the massive public investment in post-earthquake and largely unused and / or underutilized , a real capital available in many small towns in Basilicata, which, if accompanied by policies of integrated services and entertainment, which proposes to a certain target travellers the experience of living in small villages, with the pace and tranquillity typical of these areas. These trends find their natural outlet in the hospitality widespread forms of hospitality that the preservation of places, environment and lifestyles have made their *raison d'être*.

The widespread phenomenon of hospitality, understood as a hotel Countries, Villages hotel , apartment hotels and popular hotels , is now a reality that has joined the tradition, encouraged by European Union regulations as deemed to be more consistent with the sustainable development . The estimates and the available data are very encouraging and discussing a range of hospitality widespread phenomenon in Italy that involves several small and medium-sized dimension . The success of the phenomenon is also shown by the boom in publishing initiatives related to it and the increasingly wide spaces dedicated to this topic in newspapers , magazines, tourism as well as dissemination of tourist specialized guides. The most interesting model and one of the most innovative forms of hospitality is widely "Albergo diffuso", an original model of hospitality that is

configured as a phenomenon with historical and cultural roots in our country. We start talking about "Albergo diffuso" (Widespread hotel), in the early 80s in Friuli Venezia Giulia, in the process of rebuilding after the earthquake ; but it is only at the end of the decade that can be seen concrete and precise proposals and actions . At first the idea is the result of the need to recover in terms of architectural and building entire villages destroyed by the earthquake and abandoned, and takes the form of offering accommodation houses and apartments in villages mainly inhabited. The tourist offer that results is rather that of scattered houses that can be used for tourism purposes, not being provided or a hotel management of the property, or the usual hotel services to guests. It will be only from the mid-nineties , thanks to the action of intervention for disadvantaged rural areas of the European Union , with the " Leader" (Liaison Entre Actions de Développement de l'Economie Rurale) that we see a considerable increase of the achievements of widespread hospitality , which often play a central role in projects aimed at creating a stable culture of local development and to develop tourism in collaboration with the sectors of agriculture, crafts and services.

The growth of such projects , however, did not follow a harmonious and uniform spread in the peninsula , but it was more significant in some regions as compared to other Italian Sardinia , Friuli, Marche and Umbria , which have also prepared a regulatory framework by classifying the hotel widespread as distinct category of hospitality. In addition, we must specify that these innovative forms find their ground in rural areas which suffer most from the economic point of view and development. These are small towns , often, because their location and their geo-morphological characteristics are cut away from the main commercial and tourism routes, but are full of a priceless heritage in terms of culture, history, traditions and environment . These areas can find in the development of their villages a possible solution to the development and preservation of the area, focusing on the widespread hospitality formula. The first experiences of these kind of hospitality was born in 1998 in Basilicata, as a form of receptivity inserted in centres, through the initial experiment of a Country Hotel in the "Lucan Dolomites ." These various structures linked together made a hospitable village , based on structures linked together and with a unified management .This reveals that the two poles of interpretation of the concept of hospitality widespread: the widespread Hotel and the Village Hotel.

2 Widespread Hotel

According to Wikipedia Albergo Diffuso (Widespread Hotel), is an innovative concept of hospitality, which was launched in Italy in the early 1980s as a means of reviving small, historic Italian villages and town centers off the usual tourist track and is conceived as a hotel that is not in a single block, but converted out of various historic buildings in a small community. The Widespread Hotel model intends to sustain strategies for a sustainable development in harmony with social values and economic activities and respecting the cultural, environmental and landscape identity of territories. The definition that has long been used for building hotels provides "a structure deployed in more stable close to each other, with unified management that can offer hotel services to all guests", and makes explicit reference to the definition of property contained in the law May 17, 1983 n. 217. "A little 'house a little 'hotel', this is the new formula of hospitality that takes the name of "common property". The adjective "widespread" denotes, therefore, a horizontal and not vertical like that of traditional hotels. This type caters of staying in an urban setting and live in contact with residents than with the other tourists, to take advantage of the normal hotel services such as breakfast room and restaurant service. The proposal of the "Borghi hotel" was, however, exposed the first time in 1998 at the International Conference in Krakow, organized by the World Tourism Organization (WTO), with the approval of the Global Code of Ethics of the Tourism, which had an important echo in countries that had implemented policies to relaunching their "rural villages" and that they saw the solution to the problems of tourism revival of the resorts in the new concept of "Village Hotel and B & B". Since 1995, Basilicata, take away some experiments resorts urban, characterized by the "widest possible dissemination of rooms and services for tourists." It begins, therefore, to outline an initial definition of the phenomenon in Italia. A further definition of Borgo Hotel speaks of "accommodation micro structures released by strict numerical parameters and legislative constraints too stringent, closer to the concept of B&B that is not true to the hotel hospitality and proper. The key concept underpinning the formula "Hotel Borgo" is to foster the development of historic urban centres receptive, through the transformation and adaptation of rooms and houses to be allocated to the receptivity and make them available to tourists through the City, the Pro Loco, Cooperatives and Associations. The Village Hotel is certainly a form of hospitality widespread, but does not have the features or services specified by the experience of popular hotels. For this reason, in fact, the first realizations emerge quite a

few weaknesses , which are regularly encountered in operational projects . It follows that the experiences of Diffuse Hotel achieved so far corroborate a number of major strengths of this model of hospitality , as compared to other formulas such as the Village Hotel and B & B Essentially, it was the work of the GAL and the Community Leader programs , which have made a number of loans for the construction of these projects. This hospitality formula subverts the principles of traditional hotel, because it starts from the premise that less is built and the less you spend , the more you invest in culture restores and greater integration with the culture of an area and its sustainability .In the recovery of the housing is no longer used and transformed into small accommodation of quality and value, the diffuse hotel pays great attention to the environment and is in line with current standards in terms of sustainability , allowing it to be perceived as authentic. The local characteristics are also found in the interiors of apartments and rooms , each different from the others, in the name of the same, whose names are often linked to the characteristics of the territory, but which is also found in all other environments and services offered from the Hotel widespread , contributing greatly to the growth of the local and the opening of new markets for the products of the same territory .It follows that the strength of this new accommodation is the strong link with the territory, the ability to recover and promote the small Italian towns often intended abandonment and subject to depopulation , to tell the memory , art, flavours with the authentic witness of the local community .The Widespread hotel is a formula soft and is the mirror of the context in which it lies , is the cross-section of the territory in which the guest is not just a tourist, but it becomes a temporary "resident", who lives in contact with its inhabitants and their activities .Tourists first of all want to live and stay in an urban context of value, in close contact with the natural environment and cultural heritage of the locality, in constant dialogue with the own resources of the area (art, traditions, flavours , crafts , events) , but also want to experience the local flavour, breathe tradition and expects to be treated as a person , not as a common customer. Due to its characteristics the Diffuse Hotel can have the function of " animator historic cultural and economic centres " , its reception can be used as an office location information through agreements with the various Info-point in the area, so that the historic centre can revitalize maintaining an internal complexity of functions, residential , business and commercial , but especially can become a gathering place not only for tourists, but especially for the locals .The widespread Hotel, unlike traditional hotels, allows visitors to experience the authenticity of experience with living

in renovated houses and other buildings designed for tourists ; also the tourist who is focused on a widespread hotel may have at its disposal a varied range of choices offered by the operator receptive, since the product itself provides diffused hotel policies also differentiation of prices with the intent to consult with proposals diversified in different supplies .

3 Methodology

Given the relative paucity of research on AD in the south of Italy, we propose an approach for this study based on an exploratory case study (Yin, 1994) with a qualitative research design that allows a detailed exploration of the topic (Eisenhardt, 1989). Data collection involved accessing organizational documents and conducting semistructured interviews from December 2012 to March 2013 with managers directly involved with planning and implementing AD. The interviews were designed to identify specific AD practices used by Gal Cosvel, and tourist operators. These practices were explored to identify how they are implemented, and the perceived impact of these practices on tourism innovation capacity. The interviews lasted approximately two hours each and were tape recorded and later transcribed.

4 Case Study: Cosvel GAL and Widespread Hotel

In the experience gained with the Community Initiative LEADER II, the awareness that tourism grew , more and more , the almost natural location for the development of Europe's rural areas , has been the main focus for projects initiated by the Cosvel GAL : in these territories , rural tourism has been the starting point to trigger new socio-economic opportunities for growth. Even in financial terms , rural tourism has represented to this program, the most important section . A proposed rural tourism at the local level then , with a driving force of its own, creative activity in other sectors. The action had strong elements of innovation for the area where an intervention of recovery of the housing of the historic centres for tourism , had not yet been realized .The key feature of this activity was to be " open," ready to recover interest and sensitivity of the population, to define a path that would meet their needs and the intent to create a body that will assume responsibility for the management of tourism rural area .To achieve these objectives it was necessary first of all and above all that the local entrepreneurs , current and potential,become the active participants , subjects and not objects of social

transformation ; they were put in a position to develop a mentality of entrepreneurs and a business culture that is still weak and sometimes absent .The aim of the action was to determine the minimum conditions for the start of a process of tourism in the area. The owners of the houses, public or private , to obtain the leading contribution , pledged to cede use in their homes for a period of time not less than ten years.To facilitate the innovative path to the owners of the houses was given the opportunity to use the property , to the only family in the periods in which they remained free from tourist bookings.

a) Objectives and territories involved

The project is part of continuity from the previous experience gained within the Leader II , and in the context of the priorities outlined in the documents of the Regional Government and aimed at rebalancing the inland areas than in coastal areas, through the revitalization of city centres and many communities at risk of depopulation , raising new interests and new forms of investment, both public and private . The whole proposal is intended to support strategies for sustainable development, that it is placed in harmony with the social values of economic activities in being and in respect for the cultural , environmental and landscape of the territories. The specific objective is to safeguard and enhance a local heritage from decay and neglect , through attraction of financial resources, new enterprises , new jobs , giving a new economic sense to their local communities, in a manner consistent with the principles of tourism sustainable . Development , therefore , designed and managed at the local level, self-centred on the needs of a better quality of life of local residents .Administrations and areas involved include n . 9 Common: Bernalda Colobraro , Ionic Montalbano, Nova Siri , Pisticci Rotondella , San Giorgio Lucano , Tursi , Valsinni .

b) phase and feasibility study management

Assumptions regarding how receptive the unified management of the assets recovered

The widespread Hotel needs to be managed in a new way , different from traditional norms , to build its own appeal that is the ability to offer a personal and distinctive . The activity must, indeed, improve the characteristics of the offer, that is composed of a mix done by:authenticity and originality ;strong interrelationship with local resources , especially environmental and cultural ;product diversification ;proximity to tourist centers "strong" ;proximity to historical- cultural material. The feature of the service is to offer , as regards the receptivity , the substantial self-management of the stay by the tourist and therefore the possibility of maintaining a streamlined structure in the aspect of

organizational management. At the same time , however , the host must be considered , even in its autonomy , assisted in the knowledge of the area and the local culture and in the case of emerging needs and to solve everyday problems , providing real-time services .At the same time the heart of the multi- turn space used to serve as a reception, the place where the customer will be accepted, which will provide information and documentation on the territory of the village on the routes , as well as where they will be developed more technical tasks , such as the delivery of the keys, the registration of documents , etc. .It must also develop and offer ancillary services such as catering and the definition of cultural routes aimed at the enhancement of historical sites, archaeological and natural , and to enhance the scenic beauty of Metaponto. The idea is to aim at enhancing the area not only in summer, but for most of the year , creating a union between the living and the mountain resort , offering and enhancing , as well as marine areas , as well as mountain very fascinating for their purity and beauty. The peculiarity of the reference area compared to many places "quiet", which remain desolate just after the peak season , is given by the vitality of the historic centres of the country, full of events , traditions and customs, offering typical local products , which have an important role in the qualification of a place to hang out .From the point of view of the customer must be emphasized that the service is aimed at discerning travelers interested in our territory, but also to schools and social groups usually the most disadvantaged , to clarify that the product can not be offered to only one type of customers, but to a large tourist target .The problem to be solved is essentially the seasonal adjustment of the tourism proposal , today addressed , in particular through the promotion in big cities not far from the historic centres , the so-called " weekend at issue."For the future it will be necessary, therefore, create a network of potential of tourism cities and through their coordination, create the premises of a self-development, which avoids the risk of the irruption of highly disruptive form of investments in the area.

5 Results

At the end of the project were made 165 beds in 29 homes. The apartments consist of three to ten beds . Every room (from one to three beds) have private bathrooms . The average daily cost is € 15/18 per bed . The price includes utilities, the cost of cleaning the apartment (once a week) and change of linen (sheets, once a week , and toiletries , twice a week).During 2013 summer the apartments are all occupied and , in some cases, there

was insufficient with respect to the requests .The latter figure , has meant that the network would develop a " secondary " of private houses, suitably adapted to the requirements laid down standards , which are inserted into the main circuit of the house- hotel made through the Leader II program .

6 Conclusions and ideas for future research

The management model of widespread hotel is undoubtedly one of the most complex aspects of this new formula . Very often it happens that the widespread Hotel is regarded as a normal hotel business and as a result you are likely to treat it as such. This approach, in addition to being in the wrong part is especially limited . It is limited because thinking of running a Diffuse Hotel as any enterprise, regardless of the area and all its manifestations in which it is rooted , does not produce satisfactory results in terms of development and competitiveness .We already had have noted in several occasions that one of the peculiarities and characteristics of a popular hotel is its full integration with the region , its culture and its economy.This integration leads inevitably to conceive widespread Hotel and surrounding area as a single product , and as such to be managed in an integrated manner . As a result, the new generation of managers will have to consider not only the Diffuse Hotel as a new form of hospitality, but should be considered a piece of incorporation of actions, activities and projects directed towards the enhancement and especially towards the protection of the territory .No widespread Hotel is in fact accomplished if not at the time in which it moves within the territorial resources . The territory , in particular, is a key resource especially for businesses in it, not only as physical and geographical context within which performs business management, but also as a set of elements, resources, skills and knowledge accumulated over time that is a driving force for the business activity for which the individual actors that operate within it, therefore, a potential source of advantage competitive. The enhancement of the resources and skills available in the area would allow the transformation of local specificities in distinguishing factors globally, enabling companies to develop competitive strategies because the original enriched by reference to the context in which they are based. .The territory then becomes a form of economic development and as such must be managed in a strategic way .

Meetings of Minds: art and science dialogues for *sustainable* knowledge

Marina Wallace

Department of ARTAKT (Research)
University of the Arts London
University Address Central Saint Martins 1 Granary Square London
NIC 4AA

Structured Abstract

Purpose –The focus of this paper is to highlight process and outcomes of interdisciplinary communication. In particular, the starting point is an established dialogue in the field of art and science. The background to this dialogue is constructed so as a response to the request by a community of scientists to communicate to the general public their research in human cell division and mitosis.

Design/methodology/approach - The proposed approach is an arts-based practical approach, reflecting on a series of actual collaborations created between pairs of renowned artists and scientists, analysing the process and the outcome using as reference point the established field of dissemination of knowledge through comparisons and differences between professional activities and cultures.

Originality/value –This methodology puts in evidence the actual process in action of generating an exhibition and making a documentary film with the artists and the scientists, against a firm background of historical information and contemporary scientific developments.

Practical implications - The project that serves as the basis of this paper has a practical realisation of three exhibitions and one documentary film, with a series of meetings and exchanges that have taken place throughout a period of five years between artists and scientists.

Keywords – art/science, mitosis, dissemination, dialogue, documentary

Paper type – Academic Research Paper with a practical element

1 Introduction

“..a form of free dialogue may well be one of the most effective ways of investigating the crisis which faces society, and indeed the whole of human nature and consciousness today. Moreover, it may turn out that such a form of free exchange of ideas and information is of fundamental relevance for transforming culture and freeing it of destructive misinformation, so that creativity can be liberated.”

(Bohm, 1990)

The focus of this paper is to highlight process and outcomes of a specific kind of interdisciplinary communication. In particular, the starting point is a dialogue established in the field of art and science. The dialogue was constructed as a response to the request made by a consortium of scientists, to communicate their research in human cell division and in mitosis to the general public.

This paper draws on a series of collaborations created between four sets of prominent artists and four distinguished scientists, and analyses the context of the dissemination of knowledge. Parallels and differences between professional activities and cultures are under the lens. Creativity, and issues of disciplinary rigour are at the core of many of the questions posed in the project that includes a documentary film, *Meetings of Minds*, and an exhibition, *Lens on Life*. The project was devised for *MitoSys*, a scientific European research consortium. The broad aim was to establish a common ground for a new form of communication to the general public of the research carried out over a period of five years by molecular biologists, physicists, chemists, mathematicians and computer modellers working across a number of high-level European institutions. The initial proposal included an exhibition in three European cities. The final proposal had the added element of a documentary, filmed in the scientific institutions and in the artists’ studios to narrate the process and the outcomes of the dialogue established between four scientists and four sets of artists.

In retrospect, the fundamental concepts that underpinned the whole project are of a nature that may well be useful for other interactions between different disciplines, using diverse approaches and aiming to create new meanings. The idea of the Dialogue, as intended by physicist David Bohm (1917-1992), became the *leitmotif* of the whole project. Below the narrative is developed with a clear emphasis on Bohm’s ideas.

2 Dialogue

“ In a dialogue, when a person says something, the other person does not in general respond with exactly the same meaning as that seen by the first person. Rather, the meanings are only similar and not identical. Thus, when the second person replies, the first person sees a difference between what he meant to say and what the other person understood.

On considering this difference, he may then be able to see something new, which is relevant both to his own views and to those of the other person. And so it can go backward and forward, with the continual emergence of a new content that is common to both participants. Thus, in a dialogue, each person does not attempt to make common certain ideas or items of information that are already known to him. Rather, it may be said that the people are making something in common, i.e., creating something new together.” (Bohm,1990)

In spite of a plethora of different kinds of communication generated through digital and social media, it appears that “good” communication is often ailing and that new forms of effective communication are sought in order to create connections between individuals or groups of individuals. The American theoretical physicist, David Bohm, who contributed innovative and unorthodox ideas to quantum theory, philosophy of the mind and neuropsychology, advanced the view that the old Cartesian model of reality (with two interacting kinds of substance - mental and physical) was limited. Bohm established his thoughts in the light of contemporary advances in quantum physics. His contribution, amongst other things, was in the development of detailed mathematical and physical theory, of implicate and explicate order. Bohm believed that the workings of the brain, at the cellular level, obey the mathematics of quantum effects. Using the language of molecular dynamics, he postulated that thought was *distributed* and *non-localised*. The parallel with quantum entities is valid in that these do not readily fit into our conventional model of space and time. In a similar way, thought does not conform to such conventions. Bohm warned of the dangers of rampant reason and technology, advocating instead the need for genuine supportive dialogue, which, he claimed, could broaden and unify conflicting and troublesome divisions in the social world. In this his epistemology mirrored his ontological viewpoint. Bohm stated:

Dialogue can be considered as a free flow of meaning between people in communication, in the sense of a stream that flows between banks. It may turn

out that such a form of free exchange of ideas and information is of fundamental relevance for transforming culture and freeing it of destructive misinformation, so that creativity can be liberated. (Bohm, 1990)

These “banks”, were understood by Bohm as representing the various points of view of the participants.

Dialogue – he further maintained - is not to communicate. It is much deeper. It addresses the blocks in communication, not merely to understand them, but to meet them directly. It is aimed at seeing resistances to communication. In Dialogue we are ready to raise topics serious enough to cause trouble. But while we are talking we are interested in being aware of what's going on inside us and between us.

It is apparent that the word "dialogue" has many connotations. Bohm chooses to give it a particular meaning. According to the physicist, Dialogue is not about trying to make one's points prevail. The challenge is to see when one is focused on prevailing, because, if anybody prevails, it means that the dialogue has failed. Or else, if a simple agreement emerges, the dialogue may also have failed because this means that one has not gone deeply enough into the process or into the consciousness behind it.

3 Systems

3.1 Thought as system

Bohm's lectures, delivered at MIT and in Ojai, California, from the 30th November to the 2nd December 1990, addressed societal problems. In summary, Bohm wrote a proposal for a solution that has become known as "Bohm Dialogue", in which equal status, and "free space", form the most important prerequisites of communication and the appreciation of differing personal beliefs. He suggested that if these "dialogue groups" were experienced on a sufficiently wide scale, they could help overcome the isolation and fragmentation in society. Bohm proposes in his book, *Thought as a System*, a pervasive, systematic nature of thought:

What I mean by "thought" is the whole thing – thought, felt, the body, the whole society sharing thoughts – it's all one process. It is essential for me not to break that up, because it's all one process; somebody else's thoughts become my thoughts, and vice versa. Therefore it would be wrong and misleading to break it up into my thoughts, your thoughts, my feelings, these feelings, those feelings... I would say that thought makes what

is often called in modern language a system. A system means a set of connected things or parts. But the way people commonly use the word nowadays it means something all of whose parts are mutually interdependent – not only for their mutual action, but for their meaning and for their existence. A corporation is organized as a system – it has this department, that department, that department. They don't have any meaning separately; they only can function together. And also the body is a system. Society is a system in some sense. And so on. (Bohm, 1990)

Thought, according to Bohm, includes the state of the body and the whole of society – as thought is passing back and forth between people and a system can be identified in a process by which thought evolved and through which it continues to establish itself.

A system is constantly engaged in a process of development, change, evolution and structure changes although there are certain features of the system, which become relatively fixed. We call this the structure.... Thought has been constantly evolving and we can't say when that structure began. But with the growth of civilization it has developed a great deal. It was probably very simple thought before civilization, and now it has become very complex and ramified and has much more incoherence than before.

What is highly relevant to the *Lens on Life / Meetings of Minds* project is that Bohm identifies a fault in the system. He calls it a “systematic fault”. He states that the fault is all throughout the system.

You may say "I see a problem here, so I will bring my thoughts to bear on this problem". But "my" thought is part of the system. It has the same fault as the fault I'm trying to look at, or a similar fault. Thought is constantly creating problems that way and then trying to solve them. But as it tries to solve them it makes it worse because it doesn't notice that it's creating them, and the more it thinks, the more problems it creates. (Bohm, 1990, pp. 18–19)

3.2 The Cell as a System

MitoSys, stands for Systems Biology of mitosis. The brief given by the EU and the consortium of scientists included explaining to the general public the meaning of Systems Biology, an emerging approach applied to biomedical and biological scientific research. One of basic explanations generally offered includes thinking about a cell as a system, helping to understand individual cell organelle functions, and how they operate within the larger context of the cell. Other systems may be school system, the solar system, the

digestive system. What makes these “things” systems? How would one define a system? The inclusion of parts, of a whole, of inputs and outputs may be enumerated as making up a system. However, one loses the sense of the whole when focusing on the parts. It is the sense of the whole that escapes as soon as the attention is brought to the part. The initial intuition, taking into account current research but also referring back to the history of the discovery of the cell, was that looking and seeing were fundamental to the understanding that there are very small parts, invisible to the naked eye, that compose our bodies, plants and all living things. These small units, seen for the first time with the use of a microscope – hence the title of the exhibition, *Lens on Life* – were named cells by Robert Hooke in the 17th century and have been the main subject of modern biology since their discovery. This new way of seeing revolutionised how the world of living things had been previously perceived. New theories have since developed that have depended on the physical and sensory act of looking and experimenting. With this background the parallels between the creative processes in science and those in the field of the arts, became a fundamental part of the *Lens on Life* project.

3.3 Art and Science as Systems

The question that generally arises whenever a science & art project includes forms is constructed with the inclusion of artists functioning in a scientific background, or vice versa, is: what do scientists gain from the exposure to artists? And, how can artists mingle within the environment of scientists? Or, how can scientists merge within an artistic environment? It is apparent that here one is not concerned with the individual, but with the system that produces artists and scientists, even though the question is not framed as such. Systems of knowledge shift with the times. Up to the 19th century art and science were not as separate as they are now, and technology had a place that was indicative of a link between the arts and science. In the Renaissance there was no such thing as an “artist”. There were painters, architects, sculptors, etc., but the term “artist” was not invoked.

Science itself is a generic term: there are very different types of science and different kinds of investigation into the natural world. A better term might in fact have been the one used up to the 19th century, *Natural Science*, that did not exclude individuals or groups of individuals who were fascinated by the classification of natural phenomena, either experimenting with painting and sculpture or with chemistry and physics.

Paradoxically, contemporary artists may fit better into the category of *Natural Scientists* as contemporary art has, significantly since the 1930s, broken boundaries and created new paradigms. Technology, coupled with science and with art, often serves as a useful link between disciplines that would, otherwise, be separate.

4 Meaning and Metaphors

In *The Structure of Scientific Revolutions*, Thomas Kuhn describes the steps through which one paradigm, that is the set of theories, practices, applications and instrumentation that represent a model of reality to scientists, is replaced by a new paradigm. Scientific progress, according to Kuhn, does not represent a gradual accumulation of knowledge. Instead, it consists of periods of "normal" science, during which scientists operate from within a dominant paradigm, which determines the very nature of questions asked and problems posed, punctuated by paradigm shifts, when anomalies arise that the normal science is unable to deal with. Metaphors are particularly useful as models, because we use them to borrow ideas from the familiar in order to understand the unfamiliar.

The works made by the artists for the exhibition *Lens on Life* use a language that developed from their own practice, and with close exchanges with the scientists. For example, choreographer Shobana Jeyasingh, who took part in the *Lens on Life* project for MitoSys, labelled her filmed choreographed piece of dance, *In Flagrante*, in dialogue with scientist Kim Nasmyth, with these words:

Ways of Saying: Metaphor and Science

In Flagrante reflects on the flux of movement from the margins to the centre. This piece, establishes a parallel with the movement of the microtubular structures involved during mitosis and presents a physical journey filled with tension and instability, hits and misses, of search and hard won capture. The music has been treated so that the tension is condensed and the words are carved out in keeping with the extreme instability of both the microtubules and the dancer's body. (Lens on Life, 2014-2015)

5 Meetings of Minds

Throughout the project, as the definitions of cell division, mitosis and cell parts, of life and death, of movement and statics were being sought, so were the meanings of creativity, invention and experiment. It became increasingly clear that it was not possible

to give a single, comprehensive *meaning* to any of the big ideas examined in the project. If everyone knew the *meaning*, the project would have been redundant and the *Dialogue* between the scientists and the artists would have been superfluous. As it happens, in the *Meetings of Minds* and *Lens on Life* project, we got close to meanings, or to parallel meanings, to ideas that were common to thought processes, with different outcomes. The dialogue was not aimed at settling anything, as Bohm himself also predicated. The meanings were explored together - the creative perception of meaning - thinking together, looking and feeling together and, last but not least, *making* together (the art works, the exhibition, the documentary, the films, etc.). Artists Ackroyd&Harvey, labelled their drawings like this:

Ways of Being: Growth, Transition and Transformation.

Jan-Michael Peters (Institute of Molecular Pathology [IMP], Vienna) investigates the biology of chromosomes. He has been in dialogue with UK based artists, Ackroyd&Harvey, whose work focuses on processes of growth, transition and transformation across the disciplines of sculpture, photography, architecture and ecology. With Jan-Michael Peters they have experimented with random gestures and markings on paper that verge on the organic.

The restless movement of cells, and thus of our bodies, is the driving force of the piece. Working with only pencil and paper as a starting point this work has emerged from hundreds of drawings that grow, evolve and mutate. The motion appears as random, yet it is controlled and contained by a process of refinement, and suggests ambiguity of scale between the intimacy of the cell and vastness of the universe. The drawings have been inverted and painstakingly animated in a film, evoking laboratory images and the unique beauty of mitotic shapes. (Lens on Life, 2014-15)

The word “beauty” appears unapologetically, as it does in the works produced by artists Lucy and Jorge Orta in dialogue with Dresden based scientist, Tony Hyman, and by artist, Rob Kessler, in dialogue with Cambridge based scientist, Melina Schuh. But meaning is active. It is not merely sitting there. The consideration of this meaning may act - or it may not.

The idea of making a documentary, so as to record the exchanges taking place between the artists and the scientists, was paramount in the mind of the curator vis-à-vis the idea of establishing effective communication of the knowledge of cell division and scientific research for a general public. The traditional device would have been that of

explaining, in more or less successful terms, facts that are already contained in textbooks or that may be extracted from laboratory papers. The language conventionally used is often obscure for the non-initiated. The sections devised for the *Meetings of Minds*, *Ways of Saying*, *Ways of Being*, *Ways of Seeing*, *Ways of Growing*, were intentionally chosen with a poetic tone, and were instrumental for punctuating the process and attributing “portions of meaning” to the whole. Once the Dialogue was established between the artists and the scientists, the question of the chunks of knowledge that had to be imparted to the general public evaporated, and a sense of creating a new system of communication between the project participants was determined. This communication became, as it increasingly appeared, a means for “talking” to the general public through the Dialogue established between the artists and the scientists. The point of having the Dialogue is that, in spite of the task to produce an exhibition that explains the concept of cell division to the general public, one is not trying to produce a static result. That is very important. One may never do it, or it may be done at some moment when least expected. The seed has been planted. And, as David Bohm stated, “*the meaning is naturally, spontaneously active and transformative*”.

5 Conclusions

In Dialogue or in our own meditation, or whatever, the attitude is one of exploration and emptiness - that is, not having fixed assumptions but rather an empty space where there is the possibility of exploring all sorts of things. This is a proposal for exploration. But even this is not final. It too has to be constantly open to exploration - seeing whether the proposal, as made, is coherent. In other words, we're not even saying exploration is the answer. The purpose is constantly changing and flowing out of the meaning. (Bohm, 1992)

Overcoming the Seven Barriers to Innovating Personal Knowledge Management Systems

Ulrich Schmitt

University of Stellenbosch Business School
P O Box 610, Bellville 7535, South Africa

Structured Abstract

Purpose - Recently, suggestions to advance Personal Knowledge Management (PKM) have been voiced in order to provide the missing support tools for the rising Creative Class. Based on the assumption of autonomous capacities and nourished by the creative conversation of many individuals' PKM devices, the systems are supposed to support the notion that knowledge and skills of knowledge workers are portable and mobile and that a technology ought to back their options on how to maintain and develop their knowledge and on where, how, and for whom they will put it to work.

Design/methodology/approach - Currently, a prototype system pursuing this concept is about to be converted into a marketable PKM system (PKMS) by the author. This applied research paper complements a series of twelve papers which share the common verdict that a technology is overdue that aims to aid teamwork, life-long-learning, resourcefulness, and creativity of individuals throughout their academic and professional life and as contributors and beneficiaries of organizational performance. This particular paper focusses on an important concern since the realization of these kind of novel PKM solutions presently face severe barriers caused by the current paradigm, logics and logistics of centralized institutional systems thinking.

Originality/value - PKM has been placed historically in a narrow individualistic confinement negating its importance relating to group member performance, new technologies, or business processes. The recent papers have discussed different views and expectations and introduced a concept and prototype system following a novel meme-based rather than document-centric approach. One of the current papers 'PKM Devices - The next Co-evolutionary Driver of Human Development?!' also looked at it in the context of human civilization and has fully agreed with Levy's statement: "Just as computer science underwent a revolution in the 1980s with the widespread use of personal computers, it is possible that KM will in the twenty-first century experience a decentralizing revolution that gives more power and autonomy to individuals and self-organized groups."

Practical implications - As enablers of personal development and people empowerment, decentralized autonomous PKMS capacities will give individuals a better chance of navigating today's abundance of information and changing career patterns. At the same time, one of the most important functions of teaching will be to encourage in students the sustainable growth of autonomous capacities in Personal KM. It follows, that PKMS are also predestined to offer appealing and viable opportunities for other stakeholders in the educational, professional, societal, and developmental context.

Keywords – Personal Knowledge Management Systems, Knowledge Society, Creative Class, Memes, Knowcations.

Paper type – Academic (Applied) Research Paper

1 The Plight of the Knowledge Worker and Knowledge Organizations

Just a century ago, Frederick W. Taylor, considered to be the father of scientific management, stated: “In our scheme, we do not ask the initiative of our men. We do not want any initiative. All we want of them is to obey the orders we give them, do what we say, and do it quick” (Will, 1997).

Since then, the world has experienced an accelerating co-evolution of Physical and Social Technologies (Beinhocker, 2006), including ever-adapting management techniques which thoroughly transformed Taylor’s hierarchical leadership thinking.

Fittingly, Florida backs this notion in the ‘Rising Creative Class’ by referring to Barley’s observation that bosses – unlike in the old days – do not know their business better than their subordinates any more. With the growth in specializations and the evolving clusters of domain-specific knowledge, the identification of people has shifted from their company to their occupation and profession, and “the vertical hierarchy and traditional career ladder have been replaced by sideways career moves between companies, [a more horizontal division of labor], and a horizontal labor market” (Florida, 2012).

With competitive pressures on organizations continue to grow, so does the need for greater flexibility and skill sets, but “responsibility for self-development and lifelong learning is now in the hands of the individual, who increasingly controls the development of his/her career and destiny. [...] In the world of the modern knowledge worker, it has become necessary for individuals to maintain, develop and market their skills to give them any chance of competitive advantage in the job market in both the short and long term” (Pauleen, 2011).

However, the advancing development and widespread diffusion of Information and Communication Technology (ICT) has brought about profound changes in the way of working and living and caused significant organizational, commercial, social and legal innovations. As a result, work is undergoing a process of fragmentation which will continue to accelerate. Personal mastery, on the other hand, requires a capacity to concentrate on developing skill for long periods of time. To prepare for personal career

scripts that can bring fulfilment and meaning, Gratton recommends attending to and growing not only one's intellectual and social capital but also one's emotional capital as the source of self-understanding, self-reflection, emotional resilience and fortitude (Gratton, 2011).

Yet, time and concentration to become masterful is in short supply. The familiar past problem of information scarcity (few sources/channels, high associated costs) has been substituted by a never before experienced ever-increasing attention-consuming information abundance. As Simon already noted over forty years ago, the "wealth of information is creating a poverty of attention and with it a need to allocate that attention efficiently among the overabundance of information sources that might consume it" (Simon, 1971).

In our digitalized and wired world, "information in the form of pure energy can easily fly out of the door and morph into a thousand variations of the product and service we used to think we owned" (Tarlow, 2002). Similarly, "knowledge and skills of a knowledge worker are portable and mobile. Unlike manual workers, they have numerous options on where, how, and for whom they will put their knowledge to work" (Rosenstein, 2009).

What this means to enterprises has been summed up by Hamel in 'What matters now': "Today, no leader can afford to be indifferent to the challenge of engaging employees in the work of creating the future. Engagement may have been irrelevant in the industrial economy and optional in the knowledge economy, but [in today's creative economy] it's pretty much the whole game now" (Hamel, 2012).

Thus, the developments and ensuing expectations have led to a collective insight that the most valuable asset in any organization or society is investment in intangible, human and social capital and that the key competitive drivers are knowledge, creativity, and innovation.

In introducing their program on building knowledge economies, the World Bank Institute wrote: "The countries that thrive will be those that encourage their people to develop the skills and competencies they need to become better workers, managers, entrepreneurs, and innovators. Today's policy makers must extend their country's existing strengths through careful investments in education, institutional quality, and relevant technology. They must create enterprises that are knowledgeable enough to

recognize new competitive opportunities - and skilful enough to convert those opportunities into wealth” (WBI, 2008).

2 The Potential of Personal Knowledge Management (PKM)

Unfortunately, adequate responses from the worlds of academia and technology are still lacking: “About 100 years ago, higher education restructured to meet the needs of the industrial age. It has changed little since, even as the internet has transformed life. Another revolution is needed to modernize universities and prepare graduates for a 21st-century working environment. [Instead,] we continue to prepare students as if their career path were linear, definite, specialized and predictable. We are making them experts in obsolescence. We are doing a good job of training them for the 20th century” (Davidson, 2011).

Indeed, the pressing needs and resulting inefficiencies are felt strongly and manifest themselves not only as being critical of higher education not being able to transform adequately, but also as e-Learning technologies failing to deliver, academic-paper-based citation and reputation systems lagging the pace, scope, and openness of online scholarship, organizational knowledge management systems neglecting sense making and innovation as well as the detrimental effects caused by the digital and innovation divides.

As a way out of the dilemma, recent suggestions urge advancing Personal Knowledge Management (PKM) to provide the overdue support tools. Regarding its scope, Wiig reminds us that “the overall performance and viability of societies and enterprises result from innumerable small actions by individuals. Small personal 'nano actions' combine with larger departmental actions that combine to create consolidated enterprise actions that result in the performance of the whole organization. The quality and extent of knowledge possessed by people - their competence - and structural Intellectual Capital assets available to them determine the realized enterprise performance.” Hence, Wiig’s “root objective of PKM is the desire to make citizens highly knowledgeable. They should function competently and effectively in their daily lives, as part of the workforce and as public citizens. In a society with broad personal competences, decision- making everywhere will maximize personal goals, provide effective public agencies and governance, make commerce and industry competitive, and ensure that personal and family decisions and actions will improve societal functions and Quality of Life” (Wiig, 2011).

In this all-embracing context, Levy puts PKM right at the center stage of Knowledge Management. Based on the assumption of decentralized autonomous capacities and nourished by creative conversations of many individuals' personal knowledge management, PKM systems are envisaged to constitute "the elementary process that makes possible the emergence of the distributed processes of collective intelligence, which in turn feed it." In Levy's view, "one of the most important functions of teaching, from elementary school to the different levels of university, will therefore be to encourage in students the sustainable growth of autonomous capacities in PKM" (Levy, 2011).

The need for such a solution had already been articulated back in 1945. Vannevar Bush (then President Truman's Director of Scientific Research) imagined the 'Memex', a hypothetical sort of mechanized private file/desk/library-device. It is supposed to act as an enlarged intimate supplement to one's memory, and enables an individual to store, recall, study, and share the "inherited knowledge of the ages". It facilitates the addition of personal records, communications, annotations, contributions as well as non-fading trails of one's individual interest through the maze of materials available - all easily accessible and sharable with the Memexes of acquaintances (Bush, 1945).

Back to the more recent times, Davies states that PKM is continuing to be "a real and pressing problem", and also concludes - sixty-six years later - in 'Still building the Memex': "Yet it does not appear that Vannevar Bush's dream has yet been fully realized on a wide scale" (Davies, 2011). And Kahle fittingly complements: "While today we have many powerful applications for locating vast amounts of digital information, we lack effective tools for selecting, structuring, personalizing, and making sense of the digital resources available to us. [...] Designing interoperable tools with personal agency in mind empowers individuals and institutions to build, adapt, and integrate custom educational solutions in a manner that best meets their needs" (Kahle, 2009).

Indeed, the tools available disappoint: "Existing solutions address PKM needs only partially; they concentrate on more specialized as well as wider unrelated tasks and, accordingly, are usually grouped into categories such as Office Suites, Document and Bibliographic Management, Contact and Relationship Management, Group and Collaboration Software, Web Databases, and Organizational Knowledge Management" (Schmitt, 2012). Unfortunately, the realization of more appropriate solutions presently face severe barriers (the focus of this paper) caused by the current paradigm, logics and logistics of centralized institutional systems thinking.

In the author's view, what is needed is a technology "to aid teamwork, life-long-learning, resourcefulness, and creativity of individuals throughout their academic and professional life and as contributors and beneficiaries of organizational performance" (Schmitt, 2013b). During the 90s, the author started to develop a PKM prototype system which has been continuously expanded and used personally for career support as a management consultant, scholar, professor, and academic manager. Recent advances in development/hosting platforms have now provided a viable opportunity for innovation and the conversion and advancement of the prototype into a marketable application across multiple platforms and environments. The prototype's name 'Knowcations' is meant to reference our knowledge and know-how as well as the locations and spaces or the vocations and abilities which are vital to further our expertise and careers.

3 In Pursuit of the Meme-based Personal KM System 'Knowcations'

In parallel to the ongoing software migration process, fifteen papers/posters have explored pertinent issues to be briefly summarized or referenced where relevant. They share the common verdict that today's abundance of information and changing career patterns would be better addressed with a PKMS technology for individuals to create and share sustainable personalized knowledge bases/repositories over the users' life time of careers.

Levy's term 'Creative Conversations' (Levy, 2011) best describes this scenario and inspired the sketching of an exemplary network of autonomous individual PKMSs depicting potential conversation clusters, beneficiaries, and benefits (figure 1).

The underlying dynamic authoring process has been described from an individual's point of view in "How this Paper has been created by leveraging a Personal KM System" (Schmitt, 2014d). The implications and potential impact of PKM Systems have been further examined in the context of knowledge workers, organizations, and society (Schmitt, 2014c, 2014a, Schmitt, 2013f), higher education (2013a), and human development (2014b). The latter publication fully supports Levy's view: "Just as computer science underwent a revolution in the 1980s with the widespread use of personal computers, it is possible that KM will in the twenty-first century experience a decentralizing revolution that gives more power and autonomy to individuals and self-organized groups" (Levy, 2011).

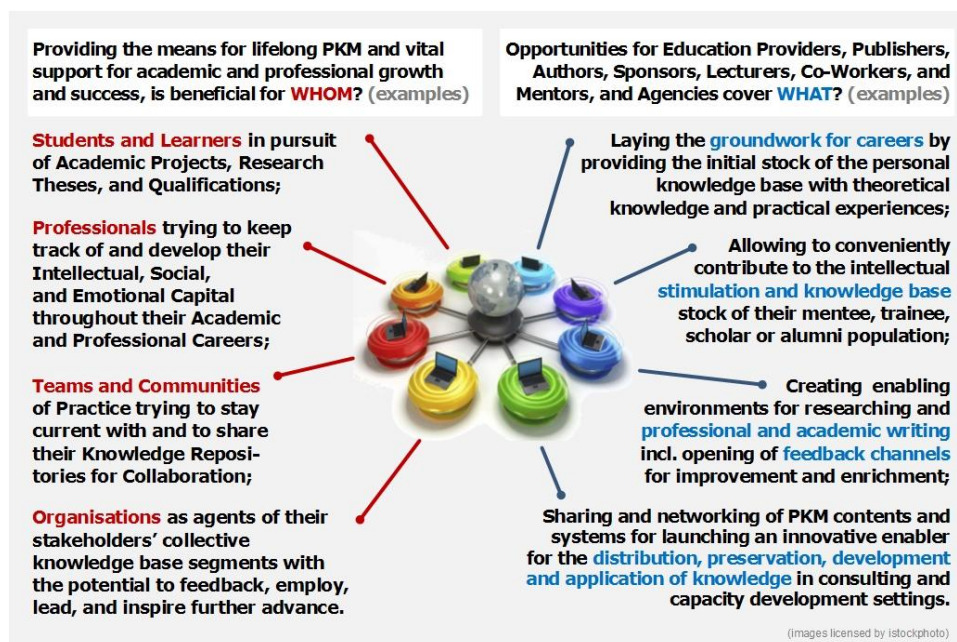

Figure 1: Exemplary Network of Autonomous Individual PKMS (Schmitt, 2013e)

Three papers have looked at the concept and workflow point of view and demonstrated a close proximity with a range of renowned models and established Organizational KM practices (Schmitt, 2014e, 2013g, 2013c). The 'Ideosphere' where these workflows and processes take place as continuous iterative learning cycles has been visualized using a three-dimensional matrix, known as an Information or I-Space¹ and presented in the papers as well as posters (Schmitt, 2013d, 2013b).

In this endeavor, the extension of the Ignorance Matrix provided a suitable base for integrating other KM methodologies and for identifying seven typical wastes in need of being addressed by PKM Systems (Schmitt, 2013e), adding to the discussion of individuals' challenges at the acquisition, preservation, collaborative, capacity development, and conceptual level (Schmitt, 2012).

As a meme-based concept, the 'Knowcations' PKMS focuses on the relevant textual, visual, audio, or video memes² a document or message contains, conserves them with

¹ Boisot's 'Information Space' model entails a three-dimensional matrix formed by the axes of codification, abstraction, and diffusion. The original model depicts the dynamic flow of knowledge assets following a 'Social Learning Cycle' through six phases: scanning, codification, abstraction, diffusion, absorption, and impacting (Boisot, 2004).

² Memes are (cognitive) information-structures that evolve over time through a Darwinian process of variation, selection and transmission. They are able to self-replicate utilizing mental storage in human hosts and to

their relevant frames of references (e.g. origins, titles, formats, licenses) and embedded in a more-dimensional classification system for subsequent easy retrieval. By digitally capturing, referencing, and visualizing these basic information units, the system allows the user to recall, edit, sequence and combine stored units with his/her own new meme creations ('nemes') for integration in any type of authoring and sharing activity he/she would like to pursue. As a result, the user obtains the means to retain and build upon knowledge acquired in order to sustain personal growth and facilitate productive contributions and collaborations between fellow learners and/or professional acquaintances. This novel meme-based approach entails a departure from current document-based knowledge management practices which has been further detailed in an 'It is a Meme's World' section of a prior paper (Schmitt, 2014e).

4 Seven Barriers inhibiting a Paradigm Shift towards innovative PKMSs

However, an enabling technological environment benefitting the novel PKM System approach has to facilitate the creative conversations between the many individuals' autonomous personal knowledge management devices. Unfortunately, such an empowering state of Extelligence¹ formation is presently facing severe constraints. Seven barriers have been identified by the author and are described below. In the context of establishing productive PKMS, they are counterproductive and annoying for wasting time and efforts of individuals, but can be eliminated by initiating sound PKM approaches, shifting paradigms, changing habits, and innovating solutions. The remedies suggested for each barrier are underpinning the notions that knowledge and skills of a knowledge worker are portable and mobile as well as concept of decentralized autonomous PKMS capacities.

influence their hosts' behaviour to promote further replication. Memes are virtual, and have no intentions of their own, they are merely pieces of information in a feedback loop which are encoded in vehicles for transmission between human hosts; this loop facilitates their continued replication as mental copies with their longevity being determined by their environment. (Dawkins, 1976; Bjarneskans, Grønnevik, & Sandberg, 1999; Collis, 2003).

¹ *Stewart and Cohen (1999) introduced the term 'Extelligence' for externally stored information; it represents the cumulative archive of human cultural experience and know-how accessible and augmentable by any individual who knows how. In their concept, Extelligence forms the external counterpart to the intelligence of the human brain/mind and deals in information whereas intelligence deals in understanding; together they are driving each other in a complicit process of accelerating interactive co-evolution.*

4.1 Barrier #1: Incompatible Formats and Structures for PKM Repositories

“To keep up and remain à-jour, we currently take copies and store them in diverse arrays of devices or make mental notes only. Over time, copies deteriorate, memories fade and with it the ability to recall the locations and contents of our fragmented personal knowledge inventories and archives. Nevertheless, we are unable to part with our accumulated hard and soft copies which slowly but steadily lapse from potential value towards dead ballast. Forgetfulness and bad memory cause our non-obsolete knowledge to deteriorate, but even if we do remember, limited access to or loss and misplacement of records might still prevent a total recall. Hence, time and effort have to be re-spent to regain the status of knowledge we once commanded” (Schmitt, 2013e).

Contents and appearance of non-digital information and artefacts can easily be recorded and digitized nowadays. The obstacle here is missing standardized formats and structures for setting up a versatile digital knowledge base for a broad range of PKM activities. Existing solutions are specialized and do not fully address PKM needs. As a result, improvised practices continue to (mis-)guide the integration of newly gathered data, information, and experiences into existing fragile frames of personal knowledge, leading to the sorry states portrayed.

Remedy: Personal contents are kept in a standardized, consistent, transparent, flexible, and secure format for easy retrieval, expansion, sharing, pooling, re-use and authoring, or migration.

4.2 Barrier #2: Bothersome Risks-of-Loss and Fragmentation of Extelligence¹

Productive PKM activities are currently compromised because any utilized digital library, e-Learning platform or other eService requires separate set-ups of individual accounts and personal or collaborative work spaces. Inevitably, replication of work and information follows and by taking advantage of the best functionalities on offer, the results created end up in disconnected external storage spaces with often severely limited opportunities for information sharing, import and export.

Unfortunately, the main stream educational and learning management systems are still focusing on centralized costly developments. With competing organizations determined to build their own and exclusive portals or social web platforms in order to capture their audience and users - often with meagre or problematic benefit for the individual – the wasteful treatment of clients’ attention and efforts is likely to continue.

Only a few years back, the OECD (2009) affirmed that ICT has not yet revolutionized teaching and learning and blamed the immaturity of e-Learning tools as well as “the cultural resistance of students and academics to use existing tools, because of some skepticism about its quality”. Although one of the authors of this study noted: “If the design of educational technology facilitates broad access and fosters personal agency and ownership, participation in adopting and evolving a new application is likely to occur” (Kahle, 2009) and other authors in the same publication also came up with suggestions of ‘personalizing’ as a potential solution, it has been mostly in the realm of add-ons to big centralized systems. The time has come for a paradigm shift towards decentralized PKM Systems.

Remedy: The added-value knowledge services of external providers have to allow for receiving relevant resources from PKM devices and the feeding back of the resulting outcomes without loss to the user’s decentralized and autonomous personal knowledge base. Consequently, digital personal and personalized knowledge (Extelligence) will always be in possession and at the personal disposal of its owner or eligible co-worker, residing on personal hardware and/or personalized cloud-databases.

4.3 Barrier #3: Disruptive Services due to Change of Personal Circumstances

This constraint is closely related to the previous one and refers to the access of centralized systems over time. The dynamics of individuals’ academic and professional lives will increase further and with it the scale of temporary associations to multiple organizations. Many of them provide dedicated digital services, but the restrictions currently imposed on users are discouraging.

Bound to location (e.g. work place, university), time (e.g. employment or study contract), technology (e.g. platform, operating system), or ownership (e.g. hardware, licenses, member status), personal engagements bear the constant risk of loss due to piecemeal version management and back-ups or sudden changes in one’s private, academic or professional life. Universities, in particular, are guilty of preventing the further exploitation of competencies learnt by simply pulling the access plug on their former staff and students and also by employing systems which are confined to education, are unaffordable by smaller enterprises or starting entrepreneurs.

Remedy: Standardized, decentralized PKM systems and interfaces ensure that information and functionalities can be continually used without disruption independent of changing one's social, educational, professional, or technological environment.

4.4 Barrier #4: Inadequate Reference Systems prevent Traceability and Vetting

Missing, broken, or pretentious web links or references are inefficient, but this also applies to the current reference and citation systems in general. Any correct reference indicates a discrete source (e.g. book, article, web site) with a page number or access date added only sometimes. It represents a granularity which might have been adequate in the stable context of paper-based worlds, but is far from sufficient in a volatile digital world where contents referenced are constantly altered or erased. It also is far too unrefined for the potential capabilities of digital Personal Knowledge Management Systems.

The problem is exaggerated by a tendency reported by Arbesman: "Too often a popular paper isn't actually read by a scientist and then cited in her own work. Sometimes scientists just look at the bibliographies of other papers and copy the citation to the paper instead. This somewhat lazy approach is unfortunately all too common, and if one scientist types it incorrectly, then suddenly there is a mutated version of the citation out in the wild." To back up this claim, he cites a study which concluded that only about twenty percent of scientists who cite an article have actually read that paper. (Arbesman, 2012)

A PKMS is expected to serve its master over a lifetime of educational and professional careers and is supposed to constantly evolve in the process. What we have to refer to and what we need to store at the same time, has to be smaller and more distinct, a basic building block of knowledge in the eyes of the beholder. Captured best in a quasi-atomic state, the information-structure should be perfectly understandable alone by itself but be able to be used at any later time in combination with other building blocks stored without piggybacking irrelevant or potentially redundant information.

Remedy: A PKMS has to support a user's cognitive capacity to identify, store, recall, and exploit atomic information-structures via reliably storing and retrieving textual, visual, audio, or video input with their relevant frames of references (e.g. origins, titles, formats, licenses), embedded in a more-dimensional classification system for easy access and as original, pre-edited, and/or already re-combined versions according to users' individual preferences and objectives.

4.5 Barrier #5: Unsuitable Concepts and Designs discourage continuous Usage

Since a PKMS embodies many entities with inherent multi-dimensional structural interdependencies, the complexity of the tasks to be handled by a user needs to be sufficiently eased by intelligible concepts and well thought-out design features. Building just a ‘better mousetrap’ is not enough to motivate PKMS users and instil in them a sustainable commitment and conviction to interact with the system on a continuous basis in order to keep it à-jour for reaping the potential benefits.

Mostert (2013) describes six levels of appreciation representing the extent to which leaders internalize learning content and examine application opportunities (from lowest to highest level): 1. Aesthetic Elegance, 2. Schematic Resonance, 3. Contextual Relevance, 4. Opportunity, 5. Responsibility, 6. Enactment.

The model can also be applied to potential PKMS users. It starts with just appreciating the idea of the proposed system (creates curiosity), followed by recognizing a close match with one’s own views (adding validity), and then with one’s own experiences and needs (adding relevance). At the fourth level, the added value towards one’s own circumstances is realized (useful to do), followed by making it a personal priority (should be done), with the final stage of successful implementation and utilization (doing). However, to keep ‘doing’, the added value generated for the user will have to significantly outstrip the user’s perceived inconveniences due to time, effort, and self-discipline invested.

The absence of an all-encompassing underlying conceptual and practical PKM model has been - in the author’s view - the main barrier hampering the successful development and deployment of potent PKM systems so far.

Remedy: The PKMS design and complex operations are based on a concept, functionalities, and interventions which are clearly understood and are painlessly applied in practice; for the system-in-progress this base consists of Dawkins’ (1976) concept of Memes and Koch’s (2002) notion of Business Genes.

4.6 Barrier #6: Better Support by Information and Knowledge Suppliers

A prior paper (Schmitt, 2013c) described how intelligent agents are handling data, information, and knowledge. If we adopt the remedy for the fourth barrier and base our decentralized PKMS on ‘atomic’ information structures (memes), the singling out, digital capturing, referencing, classification, and annotation of these memes will be the main

routine task to be performed as books, presentations, lectures, reports, images, or conversations inspire the PKMS user's mind.

Charged this way, the PKM system allows us to pursue any type of authoring and sharing activity by retaining and building upon knowledge acquired and by collaborating with fellow learners and/or professional acquaintances for mutual benefit.

These tasks could be significantly eased if the sources of interest, respectively their publishers, writers, presenters, educators, or tutors, would also supply us with their own complementing meme suggestions. In fact, rather than leaving the internalization of documents, articles, and books fully to the limited attention span of the potential user, a novel profitable market niche for open access or commercial service providers could be established to provide added value to clients in the form of document or domain specific essential meme collections or meme subscriptions. A market for similar services already exists in the form of 'Key Concept' or 'Mover & Shaker' publications or 'Executive Book Summaries Subscriptions' (e.g. SoundView, 2012) which offer speedier comprehensions via summaries of essential readings, but without the integrated meme support discussed here.

Remedy: To co-create the individual PKM Extelligence base, information suppliers are welcome to provide value-added services complementing their publications, consulting projects, or educational programs in the form of suggested meme sets or subscriptions.

4.7 Barrier #7: Constrained Horizontal and Vertical Sharing and Collaboration

Accommodating the prior six provisions opens up the opportunity to de-centrally tackle PKM by employing grass roots, bottom-up, lightweight, affordable applications rather than the top-down, heavyweight, prohibitive approaches alluded to. With an increasing adoption by members across knowledge communities, sharing and collaboration capabilities are able to facilitate horizontal networking with co-workers as well as teamwork within vertical relationships (e.g. mentee and mentor, employee and employing organization or client).

In an increasingly mobile world, PKM systems ought to partner with their organizational counterparts for pooling and feeding back records and relations for the wider benefit of stakeholders. The aim has to be to collaboratively interlink and collectively harvest prior accumulated personal knowledge subsets and also to offer

development opportunities to novices by simply leapfrogging into other knowledge domains with which they have previously not been confronted. Currently, organizational KM tools allow for privileged instant access to resource plans, progress reports, and team members' contributions for works-in-progress, but the release of the yields into the personal custodies of those contributing tends to be not part and parcel of these systems.

Remedy: Collaboration capabilities have to be mutually beneficial to facilitate consolidated team and enterprise actions that convert individual into organizational performances.

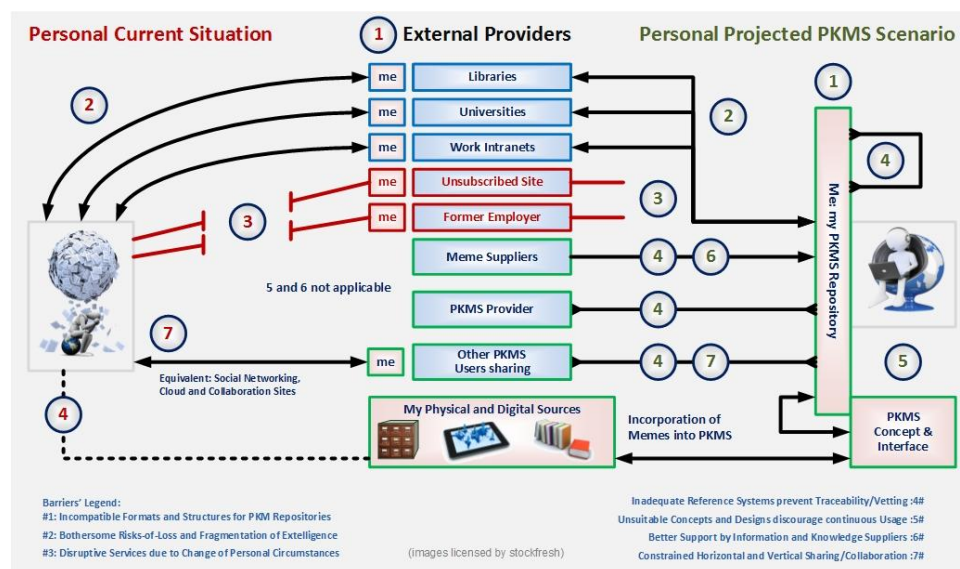

Figure 2: Current Situation (left) versus anticipated PKM Systems Scenario (right)

5 Vital Provisions for thriving Personal KM Systems and Collaborations

Figure 2 attempts to holistically visualize the implications of the barriers by comparing the current state (left) with a PKM Systems Scenario where these barriers will be eliminated (right). The remedies suggested can be summarized in form of Five Vital Provisions:

- Digital personal and personalized knowledge (Extelligence) is always in the possession and at the personal disposal of its owner or eligible co-worker, residing in personal hardware and/or personalized cloud-databases.

- Contents are kept in a standardized, consistent, transparent, flexible, and secure format for easy retrieval, expansion, sharing, pooling, re-use and authoring, or migration.
- Information and functionalities can continually be used without disruption independent of changing one's social, educational, professional, or technological environment.
- Collaboration capabilities have to be mutually beneficial to facilitate consolidated team and enterprise actions that convert individual into organizational performances.
- The PKMS design and complex operations are based on a concept, functionalities, and interventions which are clearly understood and are painlessly applied in practice.

The provisions are aiming to strengthen individual sovereignty by employing grass roots, bottoms-up, lightweight, affordable, personal applications rather than today's top-down, heavyweight, prohibitive institutional approaches and centralized developments – not at the expense of Organizational KM Systems, but rather as the means to foster a fruitful co-evolution¹.

They also agree with Levy's view of KM which "draws much more on collaborative learning networks using social media, than on the administration of central information systems controlled by experts" with their "knowledge being shut up in silos and balkanized within small closed communities" (Levy, 2011).

The provisions and the PKMS concept introduced also fit well with Johri's and Pal's (2012) call² to design ICT for development applications not only with a focus on offering effective low-cost applications (accessibility easiness), but also with adequate attention to

¹ Pasher and Ronen point out that first generation Organizational KM Systems "were about treating knowledge [merely] as an asset, recognizing how it influences strategy, and wanting to make the most of it by managing it properly." The next KM generation, they argue, needs to focus on creating new knowledge and innovation, a process which starts with the "reuse or new use of existing knowledge, adding an invention, and then creating a new product or service that exploits this invention" (Pasher and Ronen, 2011).

² Johri and Pal point out that current ICT for Development efforts "are primarily framed in the theory and practice of development and empowerment", signifying "a disproportionate emphasis [...] on fulfilling basic needs of users in low-resource environments without adequate attention to user-motivated concerns which would enrich their lives rather than merely provide access and satisfy basic needs." To overcome this gap, they advance a design framework, named capable and convivial design (CCD) and propose targeting four primary design characteristics, "if ICTD is to satisfy its purported goal of making a real difference in the lives of its intended beneficiaries - those that are significantly disadvantaged in terms of resources as well as opportunities": a. Access to Artefacts (accessibility easiness), b. Ability for Self-Expression (expressive creativity), including the ability to use personal energy creatively and to personalize the environment, c. Ability to interact and form Relationships with other People (relational interactivity), and d. Opportunity to enrich the Environment (ecological reciprocity). (Johri and Pal, 2012).

opportunities for enriching users' lives by enabling the authorship and contribution of own ideas based on one's background (expressive creativity), alone or in collaborative environments with other users/owners (relational interactivity), and with the opportunity to add productively to the world's extelligence (ecological reciprocity).

The arguments for the PKMS's potential in addressing the digital and innovation divides (Drori, 2010) are further strengthened by Gurteen's definition of the Knowledge Worker which centers around the virtue of responsibility rather than an individual's type of work (as in Florida's Creative Class¹): "Knowledge workers are those people who have taken responsibility for their work lives. They continually strive to understand the world about them and modify their work practices and behaviors to better meet their personal and organizational objectives. No one tells them what to do. They do not take 'no' for an answer. They are self-motivated". To Gurteen's mind, they "cannot be coerced, bribed, manipulated or rewarded and no amount of money or fancy technology will 'incentivize' them to do a better job. Knowledge workers see the benefits of working differently for themselves. They are not 'wage slaves' - they take responsibility for their work and drive improvement" (Gurteen, 2006).

6 PKM Considerations in the Future Digital Agendas of Governments

Thus, as enablers of personal development and people empowerment, decentralized autonomous PKMS capacities will give individuals a better chance of navigating today's abundance of information and changing career patterns. However, the even larger potential lies in the creative conversations initiated by them as well as their integration with the next generation of organizational KM expected to focus on creating new knowledge and innovation.

Collaboratively interlinking the knowledge bases available to collectively utilize and harvest accumulated knowledge subsets based on shared records and pathways rather than on redundant contents will improve the productivity of information seekers and suppliers alike. Extelligence (as the cumulative archive of human cultural experience and know-how accessible and augmentable by any individual who knows how) will flourish due to

¹ In addition to the traditional division of the workforce into an agricultural, working, and service class, Florida introduced the concept of the Creative Class as a rising and driving force of economic development. Estimated to be one third of the workforce (USA), their economic function is to create new ideas, new technology, or new creative contents as well as to engage in complex problem solving that involves a great deal of independent judgment and requires high levels of education or human capital (Florida, 2012).

more empowered individuals with better how-to-employ-and create-extelligence-skills as well as due to added knowledge memes and non-fading trails and their improved way of access.

Accordingly, commissions and governments are well advised to consider promoting PKM Technologies in their digital development frameworks. The European Commission, for example, is just undertaking a review of their Digital Agenda for Europe (DAE) to drive EU growth further digitally and to stimulate the conditions to create growth and jobs in Europe.

By responding to their InnoCentive Challenge 'The Future of ICT-Enabled Growth and Jobs in the EU: Current Barriers and How to Overcome Them' (www.innocentive.com), the author summarized the barriers and provisions presented and called for a wide-ranging political backing of autonomous Personal Knowledge Management (PKM) devices to make a crucial next difference by providing the overdue personal support tools for the problems faced today and an enabling environment for the creative conversations needed tomorrow, including liberalizing regulations for utilizing, preserving, developing, applying, and distributing PKMS's knowledge memes, directing educational and training institutions in providing better technologies and services to their staff and clients, spearheading a decentralizing KM revolution giving more power and autonomy to individuals and self-organized groups, securing the open-access availability of the knowledge memes created and shared by PKM users for the benefit of all, and appealing to the self-interest of institutional stakeholders employing knowledge management methodologies to support PKM technologies.

7 Conclusions and the Road Ahead

The critics of KM (e.g. Wilson, 2002) reason that "knowledge (i.e., what we know) can never be managed, except by the individual knower and, even then, only imperfectly". However, the distinction of Personal KM Systems, in contrast to its organizational counterparts, is to enable self-reflecting monologues of its user over life-long-learning periods of educational, professional, social and private activity and experience. In these conversations with self, the knowledge under review is biographically self-determined and presents itself as a former state of personal extelligence captured - for the time being due to the absence of brain implants - in external extensions of the individual knower's mental storage capacity. Thus, in a

personalized setting, the Utopian idea mentioned by Wilson converts into a workable scenario where individuals are indeed autonomous in the development of their expertise, and where they can determine how that expertise will be used or exchanged with people, communities, or organizations close to them.

Accordingly, the concept and prototype system ‘Knowcations’ presented in the papers facilitate establishing à-jour, well-maintained Personal Knowledge Bases and are designed to take on the role of the quartermaster and broker for sizeable portions of one's Intellectual, Social, and Emotional Capital. Above all, PKMSs should help preventing the sights encountered in the brief PKM Needs Survey depicted in figure 3 (see acknowledgements).

Figure 3: A Brief PKM Needs Survey in Flickr Images (see acknowledgements)

It is planned to transform the prototype into a commercially viable PKM software application within 18 months. The concerns to be further elaborated in future papers are the potential effects of PKMS's creative conversations on our citation-based Academic Reputation Systems and an appropriate Training and Service Concept for Personal Knowledge Management aimed at Higher Education and Professional Training.

Structured Abstract

Purpose – In contemporary city the competitiveness is increasingly played on creative regeneration to achieve a more comprehensive and sustainable development. As regards, the paper aims at illustrating the case study of creative urban regeneration of Lyon Confluence. Thanks to the Confluence renewal, that will be explained focusing on history of places, urban projects implemented, sustainable socio-economic regeneration and participation policies, Lyon is part of the Creative City Network promoted by UNESCO and is reaching quite a good ranking among world cities in Quality of living. A first assessment of critical and positive factors of this process, still under development, will conclude the paper.

Design/methodology/approach – Our approach is focused on *creative cities*, which has its origin in the research into reasons why several cities gain attractiveness and competitiveness in recent decades. Such cities improve the interaction among urban regeneration, economic development and social renewal. These experiences show that their competitiveness is based on local peculiarities shaping the *city brand*. This case study is part of a broader research programme *Innovation and competitiveness in the global economy*, in development by IRAT CNR. The objectives are: creation of a methodology aimed at identifying and designing the creative and identity resources in emblematic areas of urban transformation; identification of urban regeneration best practices; identification of guidelines for sustainable urban regenerations.

Originality/value – The case study highlights, in an original way, an integrated approach to sustainable urban creative regeneration. In fact, Lyon is an emblematic case of urban regeneration among the French cities since the main project Lyon Confluence appears a singular example. It regards a particular territory with a strong identity, and its renewal seems to be able to both preserve nature and landscape, and revitalizing local economy consistent with the culture and vision of the residents. In 1995 Lyon started the renewal process aimed at launching the city at an international level, and attempted to change the Lyonnaise identity, based on silk and industrial production, redefining it on quality of life, attractiveness and creativity.

Practical implications – The study described in this paper is related to the identification of the best practices of urban regeneration in Europe, and the conducted analysis is also aimed at gather suggestions and advice for policy makers. Although the Lyon Confluence renewal project is still under development, a first assessment of critical and positive

factors of this process which will be described in the paper, could be carried out. This include the problems observed within the urban regeneration of Confluence which are essentially of physical and relational/cultural nature.

Keywords –Creative regeneration, sustainability, innovation, place identity, quality of living

1 Introduction

In recent decades, the role of culture has become a major and often driving factor for the process of urban regeneration. The focus on culture as a factor in regional transformation has been particularly extensive in response to competitiveness among cities, but also to the needs of sustainability of the cultural sector. In the same perspective of this approach, culture in its broadest sense assumes a decisive role in constructing a system of interventions where employment, tourism, social cohesion and sustainable development become the product of the integration of places, people, economies and traditions (Scott, 2000, 2006). Indeed, there exists a wide variety of visitors and corresponding demands, and cities need to provide for new types of cultural uses, suitable for tourists as well as citizens (Richards, 1996, 2009).

The operation of regeneration in contemporary city are often based on "creativity" (Sepe, 2009,2013,2014; Martone, Sepe, 2011). The creative cities are able to generate economies of innovation, culture, research and artistic production, and hence strengthen their own identity capital. It is a question not only of boosting existing culture-based economies but also producing new economies out of cultural capital, understood as an essential element of both tangible and intangible place identity — and creating a system together with other urban capital (Carta, 2007).

Florida (2002, 2005) has observed the relationship between the transformations in the capitalist mode of production – in particular those occurring at the urban scale including the clusters of high-tech firms, the dissemination of leisure activities and the urban economic networks – and the changes in identities of the actors involved in such transformations. Florida argues that the more cities are able to seem attractive to the creative class of workers and managers in the various sectors of economy such as art, design, fashion and advanced technologies, the greater are the chances that those cities

can successfully face up to the challenges of competition among cities imposed by globalization (Landry, 2000, 2008).

In this way, the creative city recognises the complexity and addresses the spatial, physical and land use conditions which help citizens and visitors to think and act with the use of imagination and live the city as a satisfying experience.

The formation of a creative district must be accompanied by the construction of lines of action to make the factors of development consistent with identity and sustainable growth of the city (Nijkamp and Perrels, 1994). Furthermore, the development of a creative district has to be considered alongside sustainable development intended in the economic, social and environmental sense (Ferilli and Pedrini, 2007), conditions which are equally important and interdependent for the sustainability of cultural resources.

Starting from these premises, this paper aims at illustrating the case of creative regeneration of Lyon focusing on: the history of places, the urban projects implemented (with particular attention to Lyon Confluence), its socio-economic regeneration (with particular attention to the increase in jobs and tourism enhancement), the participation (focusing attention to sustainability and social cohesion).

This regeneration process, combining the public space regeneration, the cultural renewal (Fête de la Lumière) with technology (LYONRESA tourism monitor, a computer-aided information management system) and environmental sustainability (Project Renaissance, WWF One Living Planet) has contributed to bringing the city of Lyon in the Creative City Network promoted by UNESCO and reaching quite a good ranking among world cities in Quality of living.

2 Lyon Confluence

2.1 The guide-idea and the new identity

Lyon is city settled between the banks of the rivers Saone and Rhone, with a commercial area located in the peninsula, with the Rue de la République and the Place des terreaux, Place Bellecour, and an old town centre, Vieux-Lyon, Fourviere, Saint Jean.

Founded by the Romans in 43 BC, it was the commercial and military capital of the “Three Gauls”, in the XVI century it became famous for printing industry and silk processing, under Napoleonic Empire it was transformed into an industrial city, with its workers neighborhoods on the Croix-Rousse slopes and tenement built against the hill

with the characteristic "traboules" (balconies, internal courtyards and passages), while it was urbanized the Rhone left bank.

The urban structure of the Presqu'île was reorganized, between 1848 and 1863, with the opening of three new straight roads with a north-south direction, 1.000 buildings were destroyed and 25.000 people moved, the Parc de la Tête d'Or, one of three largest existent, was realized.

After a stagnating period in the first half of 1900, two agencies were established: (i) in 1968 the Communauté Urbaine de Lyon (Grand Lyon, i.e. "Greater Lyon", its former acronym being COURLY) with broad responsibilities for the government of its 55 municipalities (57 in 2007), with 1.200.000 residents, a prominent actor in economic sector, in development and coordination of urban policies and in activity of promoting Grand Projet de Ville GPV; and (ii) the Syndicat mixte d'études et de programmation de l'Agglomération Lyonnaise SEPAL, with 72 municipalities and 1.300.000 inhabitants over an area of 730 sq km, since 1985 in charge of structural and strategic planning of the area. In addition, a few laws have encouraged the centralization of inter-communal associations providing centralization of services such as culture and sport (Dragotto, 2005; Palazzo A.L., 2011).

Some critical issues, related to the coexistence of these two inter-communal authorities, were solved by institutional governance belonging, for decades, to Agence d'Urbanisme (established in 1976), a focal node between technical knowledge and political decision.

In such a scenario, the urban revitalization has been strongly supported by the transport infrastructure (airport, TGV, metro opened in 1978, tunnel that crosses Fourvière hill) and the construction of the center Part-Dieu (now second Central Business District CBD in France, behind La Défense in Paris) (Boatti, 2004).

During the '60s Lyon, as the rest of France, dealt with a huge growth in the number of inhabitants and new neighborhoods in suburbs like La Duchère to accommodate returnees from Algeria were developed. The city boasts an important architectural heritage, dating back to Roman times and the Renaissance, and for this reason a part of the city (500 hectares, one of the largest areas in the world after Venice) was classified as a world heritage by (UNESCO World Heritage site) in 1998 (Russo, 2002).

The Lyon urban regeneration process started in 1995 with Mayor Raymond Barre (Demeuse et al., 2008). The singularity of Lyon's project is given by a deep integration of

all different levels in which it is structured, ranging from the metropolitan area development strategy (Schéma Directeur) to arrangement of the urban plan and plans for specific urban areas; in which each project gain a particular value as part of a larger structure. The whole city is reorganized through the design of a new framework of thematic planning systems such as the revitalization of public spaces, in both the center and periphery, creating new centers for urban and economic development, the reinterpretation of the places of mobility and the creation of a new public transport and road network, urban parks and historic sites, and the enhancement of the urban landscape. The complex structure of planning tools and strategies works thanks to the deep internal renovation of Authorities and the continuous dialogue setup with stakeholders and committees involved in each phase (Marchigiani, 2003).

The public direction of policy and Lyon urban development, important in the context of European competition among cities, was mainly based on such tools as Schema Directeur SD, Schéma de Coherence Territoriale SCOT, Grand Projet de Ville GPV Millenaire 3.

The Lyon urban development started with the arrival of TGV in the 80's and the construction of Lyon-Satolas (renamed in 2000 Lyon-Saint Exupéry) an exchange pole between iron, earth and sky (D'Ascia, 2007).

In December 1997 Millenaire 3 started, a process, conceived by Raymond Barre, for drafting the urban area project, shared and human-centered (Lusson, 2003); then urban renewal was organized according to river and its landscape, building thematic plans (relating to public spaces, lighting, water and green).

Among the GPV objectives there is the containment of the metropolis spread, thickening and redeveloping urban areas. A flagship projects within GVP is Lyon Confluence, which begins under the Mayor Raymond Barre in 1997 and the creation of mission Perrache Confluent, renamed Lyon Confluence in 1998 together with the launch of the consultation for the redevelopment, while in 1999 the société d'économie mixte SEM was created and began the first demolitions.

Millenaire 3 and Conseille de Developpement, born as implementation of a law for inter-municipal cooperation, extend the number of actors involved, the new plan aiming at combining competitiveness and social cohesion, setting five strategic areas and twenty-one priority to make Lyon open to cultures and to the world, attractive, and able to promote entrepreneurship and learning (Dragotto, 2005). The conurbation is equipped

with a comprehensive development program, integrated with sustainability principles allowing to improve its international ranking and achieve social cohesion (EDURC 2000).

The identity of Lyon, previously linked to silk production and later to industrial production, is redefined pointing at attractiveness, quality of life and creativity.

Lyon looks like an historical city, with university, hilly, with a European and international vocation which has started a process of urban regeneration, activating also an important activities of specialized international conferences (Morandi et al., 2003). The strategic vision of urban sprawl has been identified also thanks to the reflection process Millénaire 3, animated with the involvement of Grand Lyon stakeholders through open debates, conducted over several meetings, where the idea emerged of placing man at the heart of the debate on urban design, a distinctive sign of Lyon's identity.

The shared project is aimed at develop a metropolis open to world cultures, which enriches itself by differences, which is integrated, internationally recognized, accessible and welcoming and also able to develop events and leisure activities. To communicate, and represent, effectively the dynamism of the Lyon area, twelve major economic agglomeration partners have designed a new banner, Only Lyon, addressing decision makers and the major European capitals, but also residents, so that they can, through the embedding of the "signature", express their pride and identity and become the best ambassadors for their city (D'Ascia, 2007; www.grandlyon.com/).

2.2 The urban project

The Schéma Directeur Lyon 2010 clearly stated its objectives, consistent with a medium to long-term vision, it was focused at transforming the Lyon area into an international metropolis, through the development of additional functions alongside the traditional manufacturing ones.

In SD the accomodation of public spaces, both in the city center as in adjacent municipalities, is associated with the reorganization of accessibility and the introduction of new economic and commercial activities in order to shape a balanced set that preserves and strengthens the identitarian characters of the individual areas. The importance attributed to the redevelopment of public spaces, highlights the social value of living places quality, to respond to the needs and aspirations of the inhabitants, while the strategic vision of SD sees the structure of landscape and environment as a mean to give

order to the development of the conurbation (Marchigiani, 2003). The SD was therefore an important tool for converting of the traditional economy of Lyon towards activities aimed at ICT, consolidating the transport network and enhancing the tourism potential.

The task of ensuring the implementation of SD until the approval of the Schéma de Coherence Territoriale SCOT, of handling the processing of the SCOT and monitoring and evaluating the implementation has been attributed to the Syndicat mixte d'études et de programmation de l'agglomération lyonnaise (SEPAL), technical body composed of specialists from different areas, who have collaborated to implement the plan in close coordination with State and Region Chamber of Commerce.

In 2001 Gerard Collomb was elected new President of Grand Lyon; he developed his mandate keeping the prospect of his predecessor Barre, the Millénaire 3 approach, and with the update of the reflection on the city future. Thus the ideas of development, elaborated by Lyon 2010, were reviewed through the Vision Métropolitaine Lyon 2020 (Une métropole compétitive et responsable, creuset d'une nouvelle urbanité).

This revision, caused also by the changes in social policies and by the presence of new territories, has the objectives to promote a better understanding of the territory, of "genius loci", which establishes the identity of the conurbation and of the wider region Lyon, reinforces the sense of belonging to the metropolis and its international visibility. Another objective was to involve the strategic levers available to the city in different sectors of urban policies - housing, economy, etc. - to assess their consistency and ability to meet future challenges, with the aim of creating a competitive and responsible city.

In continuity with the SD, the SCOT 2030 imagined for Lyon a balanced economic and population growth, environmentally friendly, with social equity and territorial solidarity, following principles peculiar for the area, such as multipolarity, i.e. urban development organized around a dozen living spaces, not concentrated in the heart of the city, so reducing travel; accessibility, by offering to residents of individual areas all the functions of daily life: home, work, shops and services ("mixed" city on model of the "city of short distances "); the attractiveness, promoting a denser urban development, without compromising the quality of life for residents, helping to preserve natural areas; respect of the balance between nature and the city (50/50); the presence of vegetation in urban forms a "green frame" important both for the quality of urban life as for its economic wealth and attractiveness, while the Réseau Bleu formed by the rivers is an

important component of a new living space toward the water, and also represents an alternative to the carriage of goods by road.

As explained above, the Millenaire 3 permanent program-laboratory was set up to facilitate understanding and elaboration of new development ideas, and identified a mission for the city center, initially called Perrache Confluent, then renamed as Lyon Confluence (Cioce, 2007; Demeuse, Marek, Veithen, 2008). Lyon Confluence is also the name of the main Grand Projet de Ville GPV, focused on revitalization and development of the territory and the landscape between the river banks of Saone and Rhone.

The old quarter of Perrache, known as Confluence, is an industrial suburb enclosed in the historic city center. The area, urbanized during the industrial revolution with installations of railways, a port, industrial and working class neighborhoods, began to isolate themselves from the rest of the city at North. The marginalization culminates in the 60s with the construction of the highway, and Confluence became the district of the slaughterhouse, of prisons, of the Rembaud port, while in the 70s the manufacture is displaced to areas more easily accessible and the facilities are disused. With post-industrial crisis a recovery started, on a large scale, to boost the city's image through an extensive urban planning. The re-conversion of the neighborhood Perrache is inserted into a larger urban project, which has a highly experimental character and is managed mostly by artists and landscape architects (Palazzo E, 2010).

Actions on public spaces and creation of new poles of research and attraction are linked to projects based on large relational connections, such as the reorganization of public transport lines, the road system and the protection of green spaces that reach the city center.

In fact, high-speed connections of various parts of the city, which are a constant feature of all the interventions of urban renewal in Lyon, together with great care for the public open space (Place de la Bourse, Place de la Republique and Place de Celestins, Place de Bellecour, urban parks) make the urban unit clearly perceptible (Scaramuzzi, 2005; Ferrari, 2004).

In particular, the scheme of accomodation of the central and suburban public spaces built a common language of the new identity of Lyon, a common vocabulary for urban equipment, for historic squares as well as for the suburbs. Considering the public spaces such as a structuring plot of the new image of Lyon requested the search for unitary answers to different themes such as the layout of space, physical and functional, and the

vehicular and pedestrian accessibility. These principles, contained in Lyon 2010, considers the urban landscape as one of the elements of the strategic plan, supported by different thematic plans in which the enormous commitment to innovation are represented in accordance with the history and landscape of Lyon: the Plan Lumière rearranges the light of the historical center, the Plan Vert rearranges parks, green spaces and gardens, the Plan Bleu for arrangement of the riverfront, etc. So moving from the search for the identity of places (Fourviere, Croix-Rousse, Presqu'île, Rhone and Saone) to the launch of a new vision of the city (Parc de Gerland, Cité International, Cité Scolaire International and Lyon Confluence) (Boatti, 2004; Marchigiani, 2003; Morandi et al, 2004).

The territory that, although at first sight does not have a specific vocation, has a strategic location and a large number of brownfield sites, and the re-conversion of the area provides space for commercial and port service activities. There the pôle de loisirs, the Confluence Museum, and residential areas are scheduled with the ultimate goal of strengthening the role of Lyon as a city of innovation and scientific research (Carta, 2004; Scaramuzzi,2005)

2.3 The socio-economic regeneration

In Lyon the layering, physical, economic, environmental and social of interventions done is clearly apparent. From a geographical point of view Lyon is dominated by hills in the North West who see the location of schools; in the South East wide natural spaces, green areas of quality (50% of the territory) and the wide plains, with technology poles and university town; located to the East are the large infrastructures (TGV, motorway and airport), while the downright urban structure includes the central area (Confluence), the historic center (Croix Rouse), the management center (Part Dieu) (Morandi M., 2004).

Regarding the road system one points out the International Interchange node of Lyon (highway, TGV, 3 stations) to Catalonia, Piedmont, Baden-Wuttemberg, Paris, Geneva; the establishment of a North-South axis along the Rhone, alternative to that of Milan, Zurich, Frankfurt and London; the great weight of inland waterways (planned connection Rhine-Rhone); the inclusion in the European network of high-speed trains (in Lyon three TGV stations, intercontinental airport Satolas with TGV station inside); the strengthening of iron and rubber exchange, with Grenoble, St. Etienne and Geneva (regional triangle) (Pollini, 1996).

The Confluence Project had evolutions referable in stages and articulated into two periods of fifteen years each: in the first phase, begun in 1998 and defined in 2003, the first studies were launched, the Société Anonyme d'Economie Mixte Locale SAEML Lyon Confluence to bring the project up and running was set up, consisting of Grand Lyon, Conseil General du Rhone, Voies navigables de France, Caisse des dépôts et consignations, Chamber of Commerce and Industry of Lyon, and some banks.

In 2003 SAEML became officially the project manager on behalf of Grand Lyon and signed an agreement for the public development of 150 ha; the ZAC Lyon Confluence 1a phase was created; and finally in 2008, SAEML was transformed in Société Publique Locale d'Aménagement SPLA for the study and implementation of the second phase.

In fact, Grand Lyon assigns to Société Economie Mixte SAEML the project implementation, with the establishment of the Zone d'Aménagement Concerté ZAC, an area in which the local authority decides to implement infrastructure works and major projects entrusted to a mixed enterprise; the works on tramway begins, and the tram enters in service in 2005 along the course Charlemagne, the main street of Confluence.

The first phase is developed on the areas previously freed from port activities along the Saône to the west, with the creation of an urban park along the river, a new square, the extension of the tramway. The development schedule provides a total of 340.000 square meters of which 130.000 sqm residential; business, services, leisure and hotels 120.000 sqm; 70 sqm service sector; museums 20.000 square meters.

Planned investments for the first phase of the project for about a billion euros are allocated to: City of Lyon 3%, 4% Sytral, Rhone Department 13%, 15% Grand Lyon. Private 65% (Demeuse et al., 2008). The public involvement program has a protocol that provides fairly accurate series of meetings organized (timing, participants, objectives in stages), exhibitions and other activities, an Urban Center.

In 2006 work began on the future Place Nautique, with the reorganization of the new docks. Currently the first phase is almost completed while the second phase, which began recently, will redraw the district by 2020 with a further improvement of public transport, even in light of the significant increase in mobility in France which increased from 5 km/day/person in 1960 to current 45 km/day/person (Zoltán Gábor Virányi, 2010).

The second phase began with the launch of the consultation in February 2007, the selection of the design team in July, while in September the concertation was launched, at first "professional and restricted" and in 2008 opened to public with Bilan de la

Concertation, then spaces of the Marché d'Interet National (MIN) were released. Between the years 2009-2010 ZAC Lyon Confluence phase 2 was created.

This phase will also benefit from the European program Concerto, with a budget of approximately 3.9 million euro; the project Renaissance aims at promoting in Lyon the development of a sustainable district model, with energy efficiency and renewable energy. The district consists of 21 buildings (660 dwellings and 15.000 sq.m. of office) shared in 3 blocks of buildings which have strict requirements in terms of energy efficiency, renewable energy use and social diversity, in addition a careful monitoring of energy consumption should allow a better understand of green buildings behaviours.

Perrache area consists roughly in Sainte-Blandine working-class area, in the industrial area of Port Rambaud and in the Market area, while the new Place Nautique will be the heart of the Presqu'île.

The demographic evolution of Confluence shows a loss of about 100.000 inhabitants between the '70s and the '80s; from the '90 to 2007 the increase of about 62.000 inhabitants demonstrates a good recovery in conjunction with the activities of urban renewal.

1962	1968	1975	1982	1990	1999	2005	2007
519.854	527.800	456.716	413.095	415.487	445.452	467.400	473.657

(Demeuse et al., 2008)

Currently in the area about 7,000 people live in the area, expected to reach 10,500 by the end of the project first phase and 25,000 at the end of the second phase; the three central blocks of buildings will contain a wide range of accommodation, about 44% of dwellings luxury, 33% standard and 23% of popular housing. The construction of new offices will increase the number of jobs from the current 7.000 to 11.000, and then at the end of the second phase to 22.000 (Demeuse et al., 2008; Virányi-Fontan, 2010).

Lyon Confluence also benefits from strengthened collaboration between research and business, through the creation of modern poles of competitiveness as the technology incubator CREALYS, CANCEROPOLE, etc., as well as work enhancement of scientific research; the dissemination of innovation in traditional companies putting them in network with new centers; the expansion of the international attractiveness of Lyon University.

Finally Lyon in recent years has heavily invested in developing the fields of culture and the digital, on the birth of new image industries, video games, electronic music and

new opportunities to access the knowledge offered by digital media. For the cultural portal, online since April 2007, Lyon has invested a budget of 80.000 € and boasts 30 - 40.000 users / month; it is the first cultural portal created by a French city with new services (e-ticketing, etc.).

2.4 The listening process

In December 1997 the development of an urban human-centred project, to identify challenges for the third millennium and the risks and obstacles to overcome in order to gain an international position, began in Lyon. This participatory process has aroused considerable interest and membership, thanks to the numerous meetings of working groups with the aim to identify challenges and develop appropriate proposals.

The listening process has seen the partnership of all the groups representing the diversity of the urban area: public institutions, economic institutions, universities, associations, and agents of Grand Lyon. More than 1500 people have contributed to collective reflection.

The collective, and shared, dimension of the process is reinforced by the conversations, which have gathered the opinions of the main institutional decision makers of the agglomeration on the proposed response strategy, allowing to formally associate the process with significant partners such as State, the Regional Council, the General Council, the University, consular chambers, the patronage, trade unions, cultural and religious worlds.

Among the tools to communicate and share there is the "lettre Millénaire 3", that has provided constant support, distributed to more than 7,000 addresses, to expose the progress of the process which remains open to experiences, projects and similar initiatives conducted in other places by other bodies or other individuals; the "dossier Millénaire 3" has provided a common base of knowledge on the major issues explored, and were means of sharing information and expression of points of view; a website, since September 1998, provides a citizen forum.

One of the five great challenges identified by Millénaire 3, namely "Strengthening citizenship and promote a local government system", has been implemented thanks to the contribution of Gerard Claisse, Councillor for Consultation and Participation of Grand Lyon since 2001, and of the Charte de la participation GrandLyon. The Charte, product of

a co-processing and approved in May 2003, is a political contract agreed between elected (politicians), services and civil society.

The Charte is supported by 2 goals and 3 principles and identifies 4 levels of public action. The two goals are: encouraging the participation of citizens through information, exhibitions, opening several urban centres (maison du projet), listening, encouraging expression of ideas, questionnaires, and training; and stimulate public opinion through meetings, workshops concertation and mediations. The three principles are: the consideration of a continuously evolving process; the application of the concept of subsidiarity for 55 municipalities; the adaptability, i.e. trying not to use a single model, adapting to the context.

The Public action is developed over four levels: strategies and prospects of agglomeration; public policy; projects of management and development, with the 6 GPV including Lyon Confluence; urban public services with the Charte de Qualité Publique (a development of the Charte de la participation).

Among the positive effects one can include the better readability of the public action, more effective in responding to expectations and encourage creativity; better "planning" of technical solutions, more socially acceptable; greater legitimacy of the elected (politicians) (Dragotto, 2005).

The phase one of Lyon Confluence was interested by four public meetings in order to consult residents, while six themed workshops were held in order to consult residents about the project - on transport, public spaces, housing, etc... - during phase two. Furthermore, there is a www.laconfluenceonendiscute.fr web page, resulted in over 2,000 written contributions, as reported by the official Lyon Confluence website, and the exhibition trail "Ma ville demain"/"My city tomorrow".

The Maison de la Confluence is the information and consultation centre for Lyon Confluence, where exhibitions on the ongoing project and different kinds of materials are present in order to show and explain the transformation project. The last exhibitions Traits d'union, La Confluence au coeur de Lyon, started on November 2011. During this event: inside the house, walls, large illustrations of real and virtual life-size outline of Confluence; before them, explanations of key projects are available on trees that blend images and short texts; in the video, the designers explain their actions; a 3D models, gives an idea of the future face of the neighbourhood; in the courtyard the environmental qualities of the project are compared with current standards. In addition to the visit, there

are two newspapers of 24 pages each deepening project in detail, one is dedicated to part of the Rhone and the other to Saone.

Finally, SPLA, in July 2011, launched a consultation to redesign the Lyon Confluence web site with the aim to join the three web site (lyon-confluence.fr official site of urban project; laconfluence.fr website of the territory and laconfluenceonendiscute.fr dedicated to planning the second phase) without losing interactivity and quality of information. The new website is online since spring 2012, and there is also a newsletter Lyon Confluence info’.

3 Conclusion

The problems observed within the urban regeneration of Confluence are essentially of physical and relational/cultural nature.

From a physical point of view, the main problem of the area is that Confluence appears as a triangle closed on two sides by the rivers and on the third side by railways and motorways, which form a kind of barrier to the access, rather than an attraction to people, so the main goal of regeneration, namely to extend the city center, will not be achieved until these barriers persist.

Since the center of Lyon, for about 300 years, has been represented by Place Bellecour, which is still isolated from Confluence, the only way to extend the center of Lyon to the south would be to “move” the highway outside the peninsula, but this project is almost impossible or at least extremely expensive. Therefore as long as there are such barriers, it seems Lyon cannot be equipped with a single, extended, urban center, but will be characterized by two centers in competition with each other (Virányi-Fontan, 2010).

In addition, the pressure on land that would result from the regeneration project is likely to exclude the low-income population now living in the north since the actual size of the new social housing is still unclear; further, there is no sufficient attention on ties between the city center and the right bank of the Saone (which is part of another municipality) (Demeuse et al, 2008).

An example is given by the consequences of the opening of the mall (Lyon Confluence first phase), which has already created traffic problems; so moving within Confluence with the bicycle and tram can take 25 minutes, but there are long queues at tram stops and trains are crowded, while it takes 53 minutes to go from Place de la Comédie to the mall by car.

Now, with the start of the second phase and the Marché Gare on the tip of the peninsula, the need for transport is likely to rise without an increase of the transport supply.

The cultural/relational issues concern the limits and difficulties of the transition from “participation” to “action” and from the “action” to the “cultural change” of politicians and residents.

The consultation and participation are likely to give rise to purely formal consensus, detached from the “actual” agreement on the words and their meanings. Since cultural changes are not achieved by decree, it takes time to change the culture of: (i) the elect (from the centrality of the decision to the centrality of the process), (ii) the services (from a pedantic organization to an organization capable of learning), (iii) civil society (by the defense of private interests or category to the formulation of public interests); all this requires new methods of conducting shared projects, and adequate competences (Gerard Claisse).

A good example is the Renaissance project which tries to redefine the Confluence district in an ecological way, following the principles of WWF’s (World Wildlife Fund) One Planet Living, but since the innovation of transportation is not very well planned yet, it is very difficult for people to change their habits using bicycles instead of cars (Demeuse et al, 2008).

Lyon has invested heavily in improving relationship among culture, urban space and local identity, finding a balance between past and future through innovative projects included in the tradition of economic and technological initiatives.

The first phase of Lyon Confluence is almost completed while the second phase will redraw the district by 2020 with a further improvement of public transport. Currently about 7.000 people live in the area, with almost the same number of jobs, they are expected to reach 25.000 people and 22.000 jobs when Lyon Confluence will be completed.

Even though the market laws are changing some aspects of the Lyon Confluence project and the process of sharing of the urban choices is not always privileged in this process of transformation, Confluence is part of a more general strategy devoted to the Lyon metropolitan area in which each single project assumes a role and involves interests that go beyond the revitalization of this specific area.

The investments have redefined and strengthened cultural identity, giving stimulus to participation and positive implications in terms of improving the cultural image of the city and its attractiveness for residents, tourists and investors. The regeneration of the cultural sector has been focused primarily at increasing the quality of urban life, with investment in tangible and intangible assets, such as the improvement of networks and encouragement to creativity (La Rocca R.A., 2008).

Interesting the use of festivals and events to increase the attractiveness. Here are a few examples. In fact, Lyon has also used the light as an element of urban regeneration and redevelopment, the urbanisme lumière to create the perception of a city which at night shows other faces, and the Fête de la Lumière, held in December since 1999 and known worldwide, originated from the religious traditions.

Lyon uses, in a creative way, also electronic and digital culture, including the visual creation; the festival Nuits Sonores, held since 2003 in May, in 2012 hosted about 250 artists, half from the international scene, with tens of thousands visitors, and always sold out events. Unlike the other great festivals that take place in parks outside the city, Nuit Sonores takes place in 60 locations in Lyon, using unusual places like the Charlemagne ice rink and the roof of the station Perrache.

It is also to be noted LYONRESA tourism monitor, a computer-aided information management system provided by Lyon Tourism and Conventions; it is a booking centre aimed at the general public which offers accommodation, leisure activities and holiday/tourism packages.

As detailed above, according with the environmental sustainability, present in every project of Lyon, Grand Lyon signed cooperation with WWF in order to develop the Confluence district.

All this cultural, creative, environmental and technological implementation contributed to bringing the city of Lyon in the Creative City Network promoted by UNESCO and reaching a quite good ranking among world cities in Quality of living.

Forasmuch as the media arts have been part of the Lyon's life for nearly a decade and many public events celebrating media arts in the city are becoming more and more famous, Lyon in June 2008, was appointed as the first UNESCO City of Media Arts.

Further, Lyon ranked in *Mercer quality of living survey*, 37th in 2005-2006, 36th in 2007-2008, 38th in 2010; in 2011 Paris and Lyon ranked respectively at 30th and 39th place.

For innovation economy the “2thinknow Innovation Cities Top 100 world cities rank” includes Lyon in 2009 at 10th position, in 2010 at 9th, while in 2011 the city ranked 10th globally and 2nd in France for innovation.

Since it is easier to attract “creative class” increasing cultural industries and their production, the media communication cluster in Confluence confirms this, being targeted to attract and retain students in the city, young graduates, the future creative class.

Finally, Lyon Agence d’urbanisme, aimed to make Lyon enter the Top 15 of the most competitive European Cities, set up a survey in 2006 to measure the manager perception of Lyon; the survey confirms that Lyon symbols are Economical information technologies and textile, Communication network (rail, road, river); Geographical Front door to the south of France, Geographical situation and “well-sized” equipments, Urban area dynamism, Sufficient critical mass for an international influence, Second French city and Cultural Culture and gastronomy, Ville lumière, Urban quality (Opale).

Designing Cross-Disciplinary Innovation – How to program customized Creativity in Teamwork systematically

Anja Jannack *, Jörg Rainer Noennig

Juniorprofessorship for Knowledge Architecture
Department of Architecture
TU Dresden (Dresden University of Technology),
Germany

** Corresponding author*

Structured Abstract

Purpose – The paper reports on the impact of designing a creativity workshop schedule in terms of successful cooperation and project generation. It is based on a series of creativity workshops designed and conducted by researchers of Knowledge Architecture, a new scientific field at TU Dresden. Knowledge architecture utilizes architectural processes and tools in order to develop conceptions of non-architectural items, as organizational design, product development, innovation- or knowledge management. Whereas groups and teams of divergent scientific fields and professions are focused.

Background – These days scientific research and industrial development are getting more and more complex. To find appropriate and problem-oriented solutions, different disciplines have to cooperate and collaborate closely.

Design/methodology/approach – In order to focus on the interplay of the design of the workshop and the success of the interdisciplinary teamwork a systematic framework is derived from several case studies. These workshops were documented and analysed systematically. Creative techniques were developed and successfully implemented into workshop practice.

Originality / Value / Practical implications – From the observations so far, a number of findings can be stated. Generally, the implementation of architectural methods was quite successful, and appears to be a way to increase variety, creativity, and innovations. But not only the creative techniques themselves are influencing the workshop results, moreover the design of the procedure and the arrangement of different tools, methods and sequences evolved as a key driver of successful interdisciplinary cooperation. Interdisciplinary cooperation has to be taught, learned and practiced in a long-term. Therefore a theory of creative for collectives is needed. This may be facilitated by discussed systematic and customized program of workshop design and methods of Knowledge Architecture to foster Creativity in Teamwork to design cross-disciplinary innovation.

Keywords – Creativity, Innovation, Cross-disciplinary Groups, Management, Method-Transfer

Paper type – Project Report

1 Introduction / Situation/ Background & Problem description

Creativity is one of the key skills to surviving today's world complexity. No longer is this feature held by individuals like painters, musicians or other artists only. Yet, creativity is a primary source of technological change and economic growth. As it is the base of innovative ideas it drives both academic and economic world. For those organizations it is outlined as an important attribute towards their potential of innovation, their competitiveness, and their progress (Taggar 2002; Miron et al. 2004).

The continuously increasing demand of creativity is illustrated by various amounts of literature and studies in scientific areas, and on the other hand by an overflowing offer of innovation and creativity trainings on market side; for individuals and for whole companies for each kind of industry. These days' scientific research and industrial development are getting more and more complex. To find proper answers to scientific and economic tasks different disciplines have to cooperate and collaborate closely. Now very specific knowledge is to be integrated and a common communicate-language has to be installed in order to support cross-disciplinary teamwork with its various forms. But without a systematic approach and apt methods, these groups can hardly work successfully together. A strong need for creativity and innovation is apparent not only in the scientific and industrial fields but for communities and the society too.

Since 2011, researchers of Knowledge Architecture were asked to conceive and conduct about 25 creativity workshops for different stakeholders, such as scientists, teachers, administrators or innovation- and knowledge-managers. As most of the members of Knowledge Architecture are trained architects, they are used to develop unique answers for complex tasks by using architectural means. By these workshop activities, a variety of creative techniques were developed, which are mostly based on modeling techniques and visualization tools, on design thinking and spatial representation. As one of its core endeavors, Knowledge Architecture seeks to apply architectural thinking and methods to un-architectural tasks as product development or strategically organizational design. The analysis of the workshop participant's behavior and workshop results indicated that methods of Knowledge Architecture may increase the probability of Innovation.

Besides the support via transferring of methods from one to another discipline, a problem-oriented and custom-tailored workshop design was identified as a key feature of successful interplay and to enhance the knowledge exchange of workers within, and in-between different fields. But to plan and manage a cross-disciplinary cooperation successfully and to coop within divergent teams is not an easy task. Moreover the development of single methods and creative techniques a more systematic approach is needed. This paper is going to report on the related systematic we use to design custom-oriented workshops for divergent stakeholders and settings.

2 Theoretical background

Before detailing the developed toolset and the systematic programming of the creative workshops we are going to deliver a short overview on existing theoretical backgrounds according to innovation. In the scope of this paper we focus on the following theories:

- Innovation funnel.

The model “Innovation Funnel” by Steven M. Dunphy, Professor at Illinois University, Chicago, is outlining that there have to be many ideas at the beginning in order to gain a single innovation implement on the market at the end. This one idea has passed through different filtering steps. The path to technological innovation is made up of a number of identifiable macro and micro level discriminators (Dunphy et al. 1996).

Usually innovative ideas are provided by the in-house Research & Development division of the firm- the paradigm of closed Innovation – the notion that the only good idea comes from within, a strategy of vertical integration and exclusive control. For most of the twentieth century this paradigm worked, and worked well. “If you want something done right, you’ve got to do it yourself (Chesbrough 2003).

Figure 1: Funnel Innovation

- Open Innovation

Henry W. Chesbrough, professor at Berkely University, California; argued “that companies need to look beyond their walls to thrive. Gone are the days when in-house research and development (R&D) muscle alone could dominate markets. The future’s giants will get the best bang for their research buck by bringing external ideas in and let internal ideas out” (Interview in Nature Reviews 2013). Open Innovation, already under way in variety of industries, show how forward-thinking companies leveraging the power of external ideas. Ideas bubble up in organizations of all kinds and sizes, not just in large research labs. And knowledge workers are ever more mobile, willing to take their ideas and talent to whatever firm will develop them (Chesbrough 2003).

Figure 2: Open Innovation

- Disruptive Innovation, (breakthrough, discontinuous, radical innovation)

Clayton Christensen, economist and founder of Innosight, defined “disruptive innovation” as an “innovation that makes it so much simpler and so much more affordable to own and use a product that a whole new population of people can now have one – people who, historically, didn’t have the money or skills to be in the market” (Interview in Research Technology Management 2011). He describes it as something new to the world, and a departure from existing technologies or methods; as something that creates a even new market by applying a different set of values, which ultimately (and unexpectedly) overtakes an existing market. Christensen observed that a disruptive technology initially underperforms the dominant one on dimensions the mainstream market demands, but with steady improvements it meets or exceeds those demands (Christensen 1997).

Figure 3: Disruptive Innovation

- Double Diamond

In 1990 Michael Porter's "Diamond Model" suggests some important determinants for a nation's global competitiveness. This model was extended to a Double Diamond Model in order to generalize the model and do incorporate multinational activities too (Rugman 1993, Moon 1995). This model suggests that managers built upon a domestic and a foreign diamond to become globally competitive in order to their survival and growth.

Figure 4: The Double Diamond

- Creative flow

If it comes to creativity the Flow Model of Mihály Csikszentmihály, a Hungarian American Psychologist, is essentially. He depicts that the flow is characterized by a complete absorption in what one is doing. The flow is representing a balance between over- and under-challenge. The Flow theory postulates three conditions that have to be met to achieve a flow state: 1) One must be involved in an activity with a clear set of goals and progress, 2) The task at hand must have clear and immediate feedback, and 3) One must have a good balance between the perceived challenges of the task at hand and his or her own perceived skills.

Figure 5: The Creative Flow

Idea Peristalsis – Silkworm

The mentioned theories explain some patterns of innovation from more or less an economic point of view. But for complex tasks and for creating innovation within very dynamic markets e.g. with shifting targets creativity is needed not only in the beginning – at the “Ideation process” (Knoll and Horton 2011, Husserl 1950, 1962).

On The base of our workshop experiences and structures analysis of the workshops, the participant’s behavior and resulting outcomes we formulated the following model of the “Idea-Silkworm” (figure 6). During the “invention”, the “making”, and the “re-thinking” we discovered the need of different modes of creativity in the different phases of the Ideation- and Innovation-process. This process can be described as alternate series of spread-out-generating and closing-selective creativity actions. That means that firstly modes of creativity are needed to create a large span over a wide range of ideas, themes, or problems. In a second step this variety has to be narrowed down to the focus of the given customized task and also specific competences and knowledge of the workshop participants.

Depending on the complexity and the included sequences of each different workshop the selection criteria’s are essential: Not only for finding and developing a successful result output but moreover to enhance the probability of “keep-on-working” on the result after workshop is finished (Figure 19). Hence, criteria finding is of absolute importance and has to be done as group activity discussion vise. For defining common and useful criteria creativity and creative tools are still to be developed and practiced in a more systematical way.

Figure 6: Idea Peristalsis – The Silkworm

3 Programming Creativity as a Black-Box-Model

In order to explain the systematic approach of designing a workshop, we introduce the “Black-Box” model (figure 7). To provide the customer with a fitting program, a most defined description of the target: the expected and needed resulting output is crucial. Boundary conditions as thematically contents, nature of participants, how many people take part, room dimensions and quality, or the equipment have to be taken into account. Both Customer and workshop creator have to develop a clear and common understanding of the in- and output. We hold, the assessment of customers need is the first thing to do before starting to program workshop activities. It is the foundation of a successful working program. The Black-Box itself can be described as a system which contains a various number of (creative) elements – what we call the Toolbox (Table 1; figure 8).

Figure 7: The Black-Box Model

Figure 8: Toolbox insight of the Black-Box

According to the complexity of the different targets it is possible that an outer Black-Box contains a varying number of inner Black-Boxes (figure 10). A sequence can get that composite that it is an independent Black-Box. A single sequence often have alternate followings of “being-creative”-tools – in order to open up variety - followed by narrowing down through selection tools. We state, that having a big amount of (starting) ideas is not only important in the beginning, but in the later (developing) steps as well, because a wide range raises probability of good results to evolve innovation in the end (Idea Peristalsis - figure 6). The question is how to funnel creativity target wards?

Figure 9: the Black-Box inside of a Black-Box

The design task of the workshop creator is: to find the best fitting sequences of elements and a suitable linked connection them according to the customer’s needs. So the Black-Box System is interlinked and regulated with inside. Due to its inner structure it takes the risk of being very high tact sensitivity; especially if the composed elements are successive and the results of each sequence is one after the other. According to the nature of customer-oriented output and the boundary conditions each workshop schedule has its own diagram of combined elements and programed sequences. We hold, this designed uniqueness is an important success factor.

Figure 10: Black-Box interlinked Sequences

To create a successful program two dimensions are of great interest: 1) atmosphere as well as what we call the “creative-fun-factor”-effect, 2) a certain time pressure, and 3) a (concrete) clearly explained tasks to the audience, and 4) a well moderated procedure. The Magic of being creative within a group and outside of your daily (work-)

environment usually seems to work as an easy win within a fun generating and joyful atmosphere. But to provide a certain level of output quality, each workshop group has to identify and discuss their specific criteria (Figure 19) They are extremely relevant for the selection process of focusing and narrowing down (Silkworm Figure 6). The criteria ranking is different due to the customers target and industrial or scientific sectors.

In order to get customer-fitting results one has to deliver the optimal time – in-between to less and not too much time. To be efficient it is necessary to do each step or sequence in shortest possible time within a balance of time and result-quality. Usually people find out that for the first step of idea-generation in general they don't need as much time they expected. So under conducted and moderated conditions and within an enriched atmosphere people create many (good) ideas in a very short time.

Figure 11: Time Efficiency relation

4 A closer look into the Black-Box -the (methodological) Toolbox

The main objective of the Black-Box is to offer a customized outcome. So the design task is to interconnect the different means in the best fitting and most efficient way. Therefore we developed a broad toolbox step by step. The toolbox supports the workshop creator with more or less complex tools to funnel creativity of different modes in order to ensure the output. To meet clients' needs and demands there is no standardized workshop schedule existing. Each case is supported via a unique structure though the used elements are basically same. The usefulness of most tools is proven through practical experiences. Though they always have to be adapted and modified to each new, tasks specific context.

For a more detailed expression of the toolbox elements please see authors article "Programming Creativity: Methods for Empowering Innovation in Interdisciplinary Teams (IFKAD proceedings 2013). For the scope of this paper we shortly want to sum up and add the new elements developed during the last year:

	Ideation	Content- and demand-Analysis	Selection
Visualization	 IDEATION Visualization	 PROGRAMMING Visualization	 SELECTION Visualization
Modelling	 IDEATION Modelling	 PROGRAMMING Modelling	 SELECTION Modelling
Group Interaction	 IDEATION Interaction	 PROGRAMMING Interaction	 SELECTION Interaction

Table 1: Matrix table of types of creative modules

IDEATION Visualization:

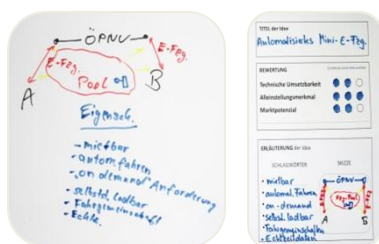

Visual protocols are widely used to capture input or keynote speeches, discussions as well as idea talks in real-time. During a talk, keywords and symbols are quickly mapped onto paper and graphically enhanced. Connections by lines, arrows etc. and extensive wording clarify the relation of the topics.

Figure 12: Visual Protocol, Key Note Speech Example 5.3

IDEATION Visualization:

Idea-sheet with evaluation form is used to catch and visualize ideas and themes e.g. during a “Speed Dating” or a small group discussion. The participants have to evaluate their generated ideas with a short evaluation form. In the example on the left the criteria were: technological realization, Unique Selling Point and

13: Idea-Sheet, Example 5.1

figure

PROGRAMMING Visualization:

Technology Roadmap is a mean to structure a defined problem-oriented solution. Therefore the different steps have to be ordered and linked according to technological dimensions and needs as partners, knowledge or skills. It is to describe the process from idea to market implication visually.

market-potentials. The Idea has to be named and explained via keywords and sketches.

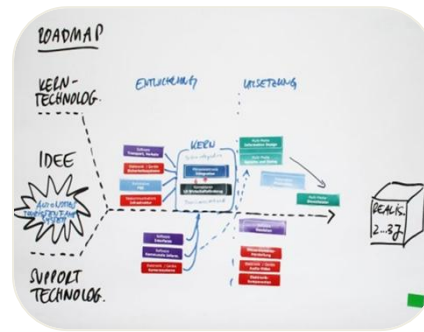

Figure 14: Technology Roadmap, Example 5.1

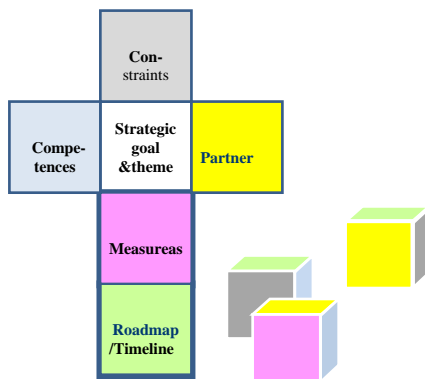

Figure 15: Strategic Cube, Example 5.2

PROGRAMMING Modelling

Strategy Cube is used to discuss the different dimensions (Constraints, Competences, Strategic goal and themes, Partners, Measures, and Roadmap/ Timeline) of a successful idea and its processing development towards an implemented innovation. As the Cube is three-dimensional it offers the opportunity of systematic “playing”. If there exists a certain amount of cubes they can be rearranged via their 6 faces – so different rankings are embody able.

PROGRAMMING *Visualization*:

Business Model Canvas is a common mean for Entrepreneurs and Developers. We apt this method to a very early stage of Idea- and Project-generation to focus group discussion on different perspectives in order to compare and rank different Ideas in a more differentiated way it a very sufficient tool. Things still to do are made visible.

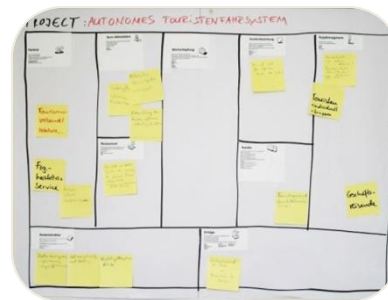

Figure 16: Business Model Canvas, Example 5.1

Figure 17: Map of Competences, Example 5.3

Figure 18 (Reworked) Map of Competences, Example 5.3

PROGRAMMING *Visualization*

Criteria finding is a mean to capture a group discussion or vote on the importance and ranking of definite criteria belonging to the different tasks and contexts. It is the fundamental base of the evaluation and selection processes.

PROGRAMMING *Visualization*

Map of competences is used to enrich the workshop environment. The Participants are asked to stick their yellow “Namecard ++” into their field of competences. Each participant has several white “Namecards ++” to stick it to field of interests.

After **reworking** this information a visual representation of competencies is deliverable. Within a closer look good matching partners - competences of one person may fit to the needs of another one – are visible. A second clue is the identification of lacks – unfilled part of the matrix – to be investigated in.

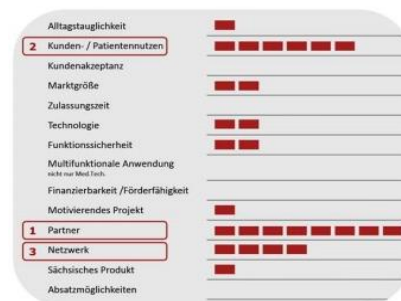

Figure 19: Criteria findings, Example 5.3

Table 2: Matrix of creative modules according to ideas level of readiness

5 Practical Sample Cases

To enhance the systematic design-work of create a concrete schedule we shortly introduce 3 sample cases of divergent workshop activities. They differ in topics, subjects, size, customer-goals and participants character.

5.1 Silicon Saxony Day 2013

Embedded in the annual meeting of the silicon cluster of Saxony, Germany, members of Knowledge Architecture conducted three parallel running workshop sessions according to the following topics: Mobility & Transport, Knowledge & Work, and Health & Demography. Round about 20 participants took part in each workshop session lasting three hours – so 60 persons in total. Each group followed the same schedule (Figure 20).

First step was to create as many ideas as possible within one hour. Than the group members depicts 3 best ideas and developed two different technology-roadmaps for each. At last step they selected 3 roadmaps and sketched a Business-Model-Canvas for this product/ project case. The customer's goal was to use the knowledge capacity of the annual company meeting and to link this with university and research competencies. They wanted to identify (minimum) one proposing project-idea of each topic to be developed locally and with-in 2-3years.

Figure 20:
Three parallel WS-Sessions

Figure 21
Roadmap of each WS-Session

Figure 22:
precise time schedule

Customer	Silicon Saxony Commercial Cluster organization
goal	Concrete Project-Ideas (to develop microelectronic sector in Saxony)
Time	Three hours
WS	three parallel Sessions
Participants	60 in total, 20 in each session Managers, R&D
Results	
Ideas	12 in each session, 36 in total
Technology Roadmaps	6 in each session, 18 in total
Business Model Canvas	3 in each session, 9 in total

5.2 Saxony Economic Development Corporation

The second example is of different nature hereby a workshop was programmed for the inner strategic orientation of an administrative “company” belonging to ministry of Economy, Work and Transportation of Saxony. Therefore two separate workshops (figure 23) were conducted in order to discuss the emerging topics and tasks for all the different industrial sectors the corporation is dealing with. Beside the identification of the “Hot-Topics”, the main focus was to enhance the inter-action and inter-communication of the people working in three separate divisions of the company.

As a first step the members of the different divisions explained shortly the topics of the last year and plans for the next focus – in a very short oral presentation. This was followed by a moderated discussion on the different topics and working plans in order to find overlapping common points of interest for the whole company. This phase was closed by the participants voting of the most virulent topic.

After this decision the participants worked in small groups on the four most important topics of common interest. To address the discussion on strategy we developed a “Strategy Cube” (Figure 15). To a real physical model (15x15x15 cm) the notes of the discussion were stuck. Each group was hosted by a member of Knowledge Architecture in order to discuss and protocol the following 6 fields of activities: 1) Strategy theme, 2) Competences, 3) Cooperation-partners, 4) constraints, 5) measures, and 6) roadmap.

Figure 23:
General flowchart

09:00 - 09:15	Start	Vorbereitung, Ziele und Ablauf der Veranstaltung
09:15 - 09:45	1. Inputvorträge	Einzelvorträge (Branchenleiter) 5-10 min + 5 min Nachfragen, kurze Diskussion der Branchenthemen, Feedback zu Vorträgen Themen- und Zeitvorgaben vorher mitteilen!

5.3 Biosaxony

The third example again is a cluster network but of a totally different nature than first one. Researchers of Knowledge Architecture were asked to conduct two separate events for biosaxony, the cluster of biotechnology and life science industries in Saxony concerning the emerging topic of medical device technology.

The first event was a public-oriented one (presentation modus) and the second one was closed to interested potential partners to discuss and interact more detailed (productive modus). Customer’s goal was to identify the important key players of this

topic in Saxony and the most virulent question interlinked. Therefore key speakers were invited to give short insights to the state of art in research and industry. This was followed by a moderated discussion in order to define criteria of successful ideation, product-development and implementation to this specific context. Presentation and discussion were documented via “visual protocol” (Toolbox: figure 12). Within the breaks people were asked to fill the map of competences (Figure 17).

During the second event all participants were enriched with 14 very short intro speeches in order to provide a common level of knowledge for the following Ideation session. During break the audience was marking their main success criteria out of a given list (Figure 19). The part was done by a “speed-dating” to gain interesting topic in-between the participants. Than the participants worked on the tree winner ideas of a blind voting to develop a concrete Project-Profile containing 1) Idea description sketch, 2) relevance of the topic, 3) Partner (research, companies, etc.), 4) core competence, 5) needs (partners, competence), and 6) Roadmap and time schedule (figure .

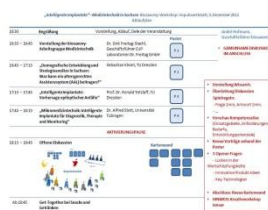

Figure 25:
precise time schedule event 1

Project-Profile

Customer	Biosaxony Commercial and Scientific Cluster organization
goal	Identify themes linked to medical device technology
Time	Two times 3,5 hours
WS	Two separate Sessions
Participants	65 First event 45 Second event 75 in total, (overlapping participants) Researchers, R&D, administrators
Results First event	
Discussion notes	30 note cards (programming visualization)

Presentation	3 Posters
Results Second event	
Input speeches	14 posters
Ideas	20 Idea-Sheets
Project-Profiles	3 Project-Profiles-Sheets

6 What kind of Creativity is needed: “programed creativity” vs. “real creativity”?

We cannot pursue an in-detail discussion of all creative elements and possible combinations and sequences here. However, it is an essential issue to clarify how the procedures are lined up, what consecution is to be followed, and what purpose, or direction such a combination is to follow. The main risk of the linked sequences is the dependence of each step towards final produced result. That means that the result of a first sequence is going to be used as the input of the following one. If there are too many sequences or Black-boxes in a line a slight un-preciseness at the beginning can increase to a big misfit in the end. Conductors can hardly regulate this process during operation. That’s why a carefully programmed schedule is required. To enhance the workshop creators with more evidence, further investigation is needed. The influencing parameters have to be described and analyzed concerning their limitations of well-working.

So fare we can assume that the amount of people and the available time – in total as well as for each sequence – have extraordinary influence to the procedures of the workshop and its outcome. If there are many people less sequences are to be integrated. If there is less time few sequences are to be selected and designed carefully.

Using systematics and clear defined outcomes for creating workshop schedules facilitate a funneled and programmed creativity. The analysis of the workshops made clear, that this system is operating adequately to reach demanded outputs with and within divergent groups in an efficient time. It is corresponding to cybernetic systems with circles of regulation and integrated loops of feedbacks. With both models – the Silkworm and the Black-Box – we introduced practicable abilities to gain momentum in terms of cooperation and collaboration of divergent groups notably regarding aspects a creative environment and an inspiring atmosphere. The fun-factor characterizing these kinds of creativity is to be used productively to encourage goal-oriented idea-generation as well as

to enhance the capability of long-lasting and trustful (working-) relationship. Though this programmed creativity is goal-oriented and funneled it differs from “real” creativity where the out coming results are not regulated or controlled. They evolve by using modes of escalation and out-of control principles. The creational process is neither bordered nor restricted, and the shape of the findings is not predictable. It can either be genius or is going to fail.

Yet, we can state that with a programmed creativity systematic customized products, ideas and project proposal can be delivered. But until now we found no indicators that it is possible to program or to mandate any kind of radical innovation by this means. Probably because those innovations need “real” creativity, uncontrolled environments and are hardly plan- or conduct able. Within the system a systematic error occurs: escalations are not possible due to systems (self-) regulation and feedback, although escalation seem to be a necessity for the origin of radical innovation. Moreover there is a lack of scientific examination on demands and the special (spatial) conditions as well as o the influencing factors of this formation. These insights are necessary to develop strategies to raise the probability of these innovations systematically.

7 Summary

However, we outlined a systematic toolset for innovation engineering. Although the workshop schedule we plan a very precise, a certain amount of risk and unexpected contingencies still exist. Because working with people in a – for them – unconventional and unfamiliar way is risky, of course. So why do we need an accurate plan – if real situation may differ? It is mandatory not in terms of a strict accomplishment but in order to ensure conductors awareness of the goals and the single steps needed to reach the goals. If the conductor is using it as the best working framework he is free to act very agile during workshop operation. The plan enables him to take care of the needs and competences of the in real involved participants and same time not to lose orientation in creative production in order to develop best possible results.

Due to the increasing complexity of future knowledge work, the different stakeholders have not only to be supported in spatial, technical and monetary terms but also be encouraged with transferable methodological support. Future cross-disciplinary knowledge worker have to be supported and trained right now. Interdisciplinary cooperation has to be taught, learned and practiced in a long-term. Therefore a theory of

creative for collectives is still in need. This may be facilitated by discussed systematic and customized program of workshop design and methods of Knowledge Architecture to foster Creativity in Teamwork to design cross-disciplinary innovation.

Structured Abstract

Intellectual capital (IC) is a key driver in value creation. According with the above more and more companies, for profit as well as no profit organizations (NPOs), direct their attention to new tools able to communicate to the stakeholders their intangible assets as value creator driver.

IC in for-profit companies, but especially in NPOs is positively correlated with the performance. For this reason, during the last years the interest in the importance of IC in NPOs is increased.

IC report becomes a fundamental tool in the disclosure of the NPOs' activities. Nowadays is necessary to use a correct frame work to represent the IC in terms of knowledge, skill, procedures and relationship spread into the organization.

The aim of the paper is to propose an original framework for IC report addressed to NPOs.

To reach paper's aim the work is developed as follow: first of all is examined existing literature on NPOs and IC in order to identify relevant features of IC in NPOs, and are focused relevant aspects to be measured by IC indicators and disclosed by IC report in the above context.

Then are outlined extant frameworks for IC report in order to verify if they fit the aspects qualified as relevant in NPOs and point out what they lack with reference to NPOs context.

On these basis the work proposes an original framework, with a new set of indicators inside, that would better fit to NPOs features.

Finally the proposed framework is tested in an Italian NPO.

The result is to disclose new aspects of the activity carried on by NPOs on the side of knowledge, skill and relationship with the surrounding community.

Purpose – The research is focused to build an original IC framework through a set of indicators able to disclose IC in the NPOs context.

Design/methodology/approach – After a review of existing literature and of IC in order to identify relevant features of IC in NPOs, and are focused relevant aspects to be measured by IC indicators and disclosed by IC framework in the above context. Then the model is tested on an existing Italian NPO

Originality/value – An original IC framework and a new set of indicators for IC in the NPOs, tested an Italian NPO, offer a new disclosure of the activity carried on by the organization on the side of knowledge, skills and relationship with the surrounding .

Practical implications – The findings appear to suggest an innovative model of IC framework for NPOs with a significative set of indicators. The work is tested only on an Italian NPO which can be extended in the future to other NPOs both Italian and non Italian.

Keywords – No profit organizations, IC framework, IC indicators

Paper type – Academic Research Paper

This work is fruit of joint reflection and collaboration. For academic reasons section 1 is attributed to Franco Ernesto Rubino, section 2 and section 4 are attributed to Giovanni Bronzetti, section 3 and section 5.5.2 are attributed to Paolo Tenuta, section 4.1, section 5.3, section 5.5 and section 5.5.3 are attributed to Rija Maurizio, section 5.1 and 5.2 are attribute to Eugenio Vite, section 5.4, 5.5.1 and 6 are attributed to Graziella Sicoli.

1 Introduction

Intangible assets are considered, worldwide, very important because are resources difficult to imitate and socially complex, able to create value for organizations. The importance of intangibles and among this of the intellectual capital (since now IC) in non profit sector (since now NPOs), generates the need to measure its role in the value creation process. In fact, in contrast with what happens in the for profit sectors, where everything is measured quantitatively, in the non-profit sector the importance of communicating and demonstrating to stakeholders the quality of services provided (Stewart, 1997) respect of other public or private subject, is determinant to generate social value.

The NPOs includes the new model of Welfare State based on public service but increasingly characterized by important private initiatives.

The NPOs is the sum of private, voluntary, and non profit organizations and associations. It describes a set of organizations and activities next to the institutional complexes of government, state, or public sector on the one hand, and the for profit or business sector on the other. The “third sector,” is a sector that has gained more

prominence in recent years—in the fields of welfare provision, education, community development, international relations, the environment, or arts and culture. The NPOs or third sector has also become more frequently the topic of teaching and research, it has become a major economic and social force.

The reference frame is therefore very broad and diverse and it is characterized, at least in part, by a fragmented legal framework whose only common denominator is the absence of the profit motive as a driving force (Cohen, 2007).

NPOs are today commonly operating in a highly competitive environment that is characterised by increasing demand of services from the community, IC enables NPOs to enhance their performance by providing meaningful information to organisational stakeholders.

NPOs in many developed countries thus have been operating in new public management environments, facing performance challenges and therefore expressing a need for new management tools in the same way as private companies.

From this point of view IC, measurement and reporting originally a private sector oriented metaphor, is increasingly viewed as a new conceptual framework for non profit setting (Kong and Thomas, 2006).

Recent study (Kong and Prior, 2008) indicates that the role of IC in the NPOs is more critical than in the private sector due to the fact that intangibility is even more present than in the case of private organizations in terms of their goals production processes, focused on human capital and output (Ramirez, 2010).

Intellectual capital (IC) is one of the key determinants of companies' business performance (Schiama et al., 2007). In service organizations and therefore in the NPOs the role of IC is crucial because the outcome of activities is heavily based on, e.g. the efforts of skilled personnel, fluent processes and other intangible factors, while the role of tangible resources such as machines is not as important (Kujansivu and Lonnqvist, 2009).

In the NPOs, the intangible aspects of operations are further emphasized: for those organizations improving the wellbeing of clients or other stakeholder groups is more important than financial success.

Several studies indicate that unique or scarce resources impact firm performance (Barney, 1991; Castrogiovanni, 1991; Grant, 1991; Mahoney, 1995; Nahapiet and Ghoshal, 1998; Pfeffer and Salancik, 1978; Tsai and Ghoshal, 1998). For instance, Barney (Barney, 1991) suggests that NPOs have a competitive advantage when their

assets, capabilities or processes possess specific attributes. That is, when assets, capabilities or processes are rare, valuable, difficult to imitate, and have few substitutes, they represent a critical source for competitive advantage.

In this context are IC studies proposed as a novel managerial approach in NPOs (Kong, 2007a; Kong, 2009; Kong and Prior, 2008). In companies the significance of IC is acknowledged and several frameworks for managing and developing IC have been introduced (e.g. Kujansivu, 2008). However, the issue is relatively new to NPOs (Kong, 2008). Thus there are many open questions. There is also a lack of empirical research in the topic because only a few empirical studies have been carried out (Fletcher et al., 2003; Kong, 2007b). This paper builds on the few studies conducted so far and examines how IC could be taken into account in NPOs.

After a brief review of national and international literature on IC, suggesting that IC can be utilised as a competent strategic management conceptual framework in NPOs. IC is an important resource that NPOs need to develop in order to gain sustained strategic advantages.

The research is focused to build an original IC framework through a set of indicators able to disclose IC in the NPOs context. After a study of existing literature and of IC in order to identify relevant features of IC in NPOs, and are focused relevant aspects to be measured by IC indicators and disclosed by IC framework in the above context. Then the model is tested on an existing Italian NPOs, offer a new disclosure of the activity carried on by the organization on the side of knowledge, skills and relationship with the surrounding community. The findings appear to suggest an innovative model of IC framework for NPOs with a significative set of indicators.

2 The third sector: evolution of the phenomenon

According to the International classification of Non Profit Organizations include 12 different groups:

- culture and recreation
- education and research
- health
- social services
- environment
- development and housing

- law, advocacy, politics
- philanthropic intermediaries and voluntarism promotion
- International
- Religion
- business and professional associations and unions
- organization not elsewhere classified

The third sector includes a variety of different organizations and associations, is active in many areas of economy ranging from healthcare, social services, employment and culture to environment (OECD, 2003). Compared with private companies the characteristics of NPOs include the following:

- are value-driven, instead of profit-driven;
- stress the local dimension in their activities;
- provide and develop services based on needs which are often not recognized by public authorities;
- offer not only services for clients but also often do community work and/or advocacy work;
- train and engage volunteers as part of the service staff;
- may have a special approach in their work, e.g. social goal, value goals,
- empowerment or religious approach. (Borzaga and Santuari, 2003).

NPOs are increasingly involved in welfare, health care, education reform, and public-private partnerships and rural and urban planners use nonprofit and community organizations for local development and regeneration.

All these developments suggest that NPOs are part of the transformation of societies from industrial to post-industrial, and from a world of nation-states to one of transnational, even global, economies and societies, where the local level nonetheless achieves greater relevance and independence. The full recognition of the immensely elevated position and role of NPOs at the beginning of the twenty-first century is the main difference to the latter part of the previous century, when nonprofits were “(re)discovered” as providers of human services in a welfare state context. NPOs are now seen as a part of the wider civil society and welfare systems of modern societies.

The phenomenon of non-profit has grown not only because of the crisis of the Welfare State, but also because of a variety of factors, among which we can include:

- economic development as well as rising incomes, has led to an increase in activity as a result of voluntary and charitable;
- the emergence of new needs and the different and specific services;
- increasing employment and economic in this sector.

This situation has been favored by the spontaneity and good will of many citizens, who have joined together in groups (associations, cooperatives etc.) in order to provide answers to serious social problems. (Chaminade & Catusus, 2007).

According with last Italian census of 2011 NPOs active in Italy are about 301.191 with a disomogenea distribution on the territory. 55,2% NPOs is in the north Italy, 21,5% in the Centre and 16.6% in the South. The rate per person is is 38,4% every 10.000 people. The indicator per resident indicates that in Italy are active 38,4% NPO's every 10.000 people.

Today, NPOs regularly find themselves sharing the same territory with for-profit organizations, sometimes as collaborators, but probably more often as competitors (Ryan, 1999). NPOs are now expected to adopt for-profit competitive strategy approaches (Weerawardena and Sullivan-Mort, 2001). A NPOs gains competitive advantage when it consistently outperforms its competitors,

Although this performance is not measured in the same way as it is in for-profit organisations.

Today, as physical assets and financial capital are no longer the primary resources that facilitate competitive advantage but intangible and IC resource ensure competitive advantage (Kaplan and Norton, 2001; Wall et al., 2004)

Nowadays, the role and contribution of NPOs are more important and strategic. Various circumstances place NPOs activities in competitive environment and require a complex management. This makes the demand of NPOs management should conducted in a more professional, modern, and use the concepts of strategic management. In fact, the performance measurement models that have been developed are tend to profit-oriented organizations, while performance measurement model according to the characteristics of NPOs is still relatively limited. The lack of this limitation, is inadequacy the stage of identify and determine the aspects of NPOs interaction with internal and external parties that demands of higher levels of capabilities (the need for the level of the knowledge based organization). While the difficulties to develop a mechanism of quantify intangible

assets elements, is the intangibility of the leading indicators that expected to perform quantitative value of organizational performance achievement. This constructive research is to develop a performance measurement model according to the characteristics of NPOs based on the intellectual capital.

The fundamental difference between *NPOs* and for Profit Organization is focused on the main reason of the establishment of the organization. Simply is possible to say that main purpose of Profit Organizations is to create financial advantages for its shareholders through profits from the goods/services traded. On the other side the main purpose of the *NPOs* is to meet the social needs of a community or of its members. In return, the *NPOs* not only provide services that are owned but also need to consider all the consequences arising from the services they have. Therefore there is a difference between the groups perspective Profit Organization *NPOs*. Here are the general differences between Profit Organization and Non-Profit Organization.

3 Intellectual capital: literature Review

Intellectual capital was focused as the new concept of wealth of an organization. From this perspective the definition of IC has been the object of discussion by both academics and men of business¹. In general, all major author share the idea that intellectual capital, from a qualitative point of view, can be divided into three categories: human capital, structural capital and relational capital, as defined by the model of Bontis (Bontis, 1998). Although the labels used to identify categories in which intellectual capital can be classified are different for different authors, the content of these categories is more or less similar (Bontis, 2000).

According to Bontis (2002), Daum (2003), Vaškeliėnė (2003), Hitchner (2006), Sáez et al. (2007), Fitz-enz (2009), and Dubra (2010), *human capital* is perceived as the entirety of knowledge, skills, education, experience, talent, innovativeness, competence, motivation, loyalty, creativity, ability to perform a task and deal with arising issues, leadership, business skills, management and ideas leading to new products of the staff of an enterprise. It also covers the value, culture, and philosophy of the enterprise. This capital is denoted by its inability to belong to the enterprise. Claims are produced that this capital is one of the core and most influential resources of the enterprise in competitive

¹ *Beyond lexical distinctions, for a brief summary of the major classifications of intellectual capital see Hunter – Webster – Wyatt, 2005; Pike – Roos, 2005; Marr - Adams, 2004; Edvinsson e Malone, 1997, Sveiby, 1997).*

fight as the ability of the enterprise to compete in the market depends on the knowledge and skills amassed by its staff, i.e. on the efficiency of the human capital.

According to Bontis (2002), Daum (2003), Vaškeliënė (2003), Hitchner (2006), and Sáez et al. (2007), *organizational capital* is perceived as the organizational and financial structure of an enterprise, its strategic processes, technologies, procedures, process documentation, risk assessment methodology, technical equipment, software, systems, the use of information technologies, databases (e.g., the ones covering information on the market and clients), patents, trademarks, methods of sales management, communication systems and all other organizational capabilities supporting the productivity of the personnel and facilitating their productive cooperation. A claim may be produced that it covers the technologies, methodologies and processes that enable the functioning of the enterprise. In other words, it remains “inside” the enterprise after the completion of a work day when the staff has left. Differently from human capital, this type of capital may belong to the enterprise, and the enterprise may thus handle it. This capital is considered the second most important capital of an enterprise after human capital.

According to Bontis (2002), Daum (2003), Vaškeliënė (2003), Sáez et al. (2007), and Fitz-enz (2009), *relational capital* is conceived as the awareness of the enterprise, its trademarks, brands, image, external networks and complete orders, its supply streams, long-term contracts, license and franchise agreements and relations with external individuals founding the marketing and commercial capabilities of the enterprise. In this context, external individuals include not only clients / consumers, but also business partners, suppliers, and regulatory institutions.

According to Maditinos et al. (Maditinos et al.,2012), only by nurturing intellectual capital organizations will be able to remain competitive, fight against the severe competition (both domestic and foreign), and create sustainable competitive advantages. That is why organizations need to evaluate their intellectual capital and its components, and monitor their development and performance.

Also the Meritum report validad the three-way division of IC into: human capital, structural capital and relational capital

1. *human capital*: skills, experience, competence and innovation ability of personnel who work within the company. This is a knowledge that is not owned by anyone except the person who owns it. Therefore, the company to secure a

sustainable competitive advantage over time, recognize that resource and hold it within the organization;

2. *Structural capital*: organizational processes and systems, software and databases and business processes. All the elements that compose the structural capital constitute assets on which it is appropriate to invest because they are property of the company;

3. *Relational capital or customer capital*: all resources linked to the external relationships of the firm with stakeholders, such as, customers, creditors, investors, suppliers, etc.¹.

The reference structure of and IC report, according to the Meritum project must include three parts: the firm's vision, which is a narrative of firms strategic aims and critical intangibles, a brief summary of intangibles resources and intangible activities, visualized under the three IC categories, which must developed to reach strategic aims and a system of indicators to allow the reader to judge whether the firm's behaviour is coherent with strategic aims (Veltri, 2007).

In this model IC are positioned with respect to two dimension: the four types of knowledge resources (employees, customers processes and technologies) and the three evaluation criteria (effects, activities and resources).

The Austrian Research model incorporates the IC frame work validated by Meritum project with the process logic of organizational research processes proposed within the innovation and research evaluation literature.

The three components, human capital, structural and relational, are not independent, but complementary and are not intended to interfere with the economic objectives, but to instill an ethical content to the financial decisions, which contributes to the protection of the environment and a better society.

¹ The term "intellectual capital" is used synonymously with "intangibles": both are non-physical sources of future economic benefits that may or may not appear in corporate financial reports (Meritum, 2002).

Source: Petrash (1996)

Figure n. 1 The value platform IC

The key challenge for both researchers is understanding how to measure and manage knowledge assets dynamics, their interaction at the basis of organizational value creation capacity bearing in mind that measures are required but they should derive from the organizations knowledge strategy and should integrate the story of how IC is mobilized via knowledge narratives.

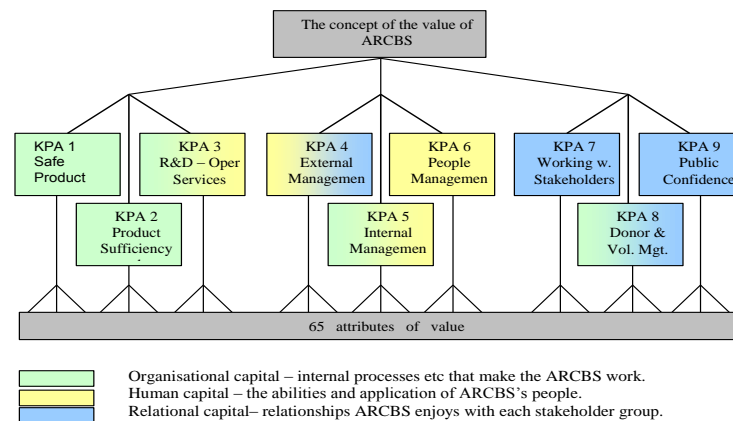

Typically, IC have been study through the lens of private sector but this fact does not render the concept of IC or the importance of IC reporting less valuable for nonprofit sector settings

The strategic importance of the IC, the NPOs have developed new forms of reporting both in the interest of communicating to stakeholders the commitment to the reconciliation of their instances, and the need for tools to support the management in respect of the stakeholder view (Baur, Fenn, 1972; Mathewes, 1993; Gray, 1996).

4 IC and NPOs

An area that has not attracted studies addressed to the implementation of IC report is the NPOs (Guthrie et al., 2009). This is surprising considering the importance of IC in service provision that is both illustrated (Fletcher et al., 2003) and claimed (Steane, 1999) by third sector organizations themselves, which consider intangible resources as the differentiating features of the sector. Among the few studies on ICR in the NPOs, we must cite the research of Fletcher et al. (Fletcher et al, 2003), focused on the intellectual capital of the Australian Red Cross Blood Service (ARCBS), a complex non-profit organization providing specialized services in the health industry, which belongs to this kind of study. The main research aim was to understand better the value that ARCBS

holds for its different stakeholder groups. The value is represented in a comprehensive value hierarchy, which reports stakeholder perceptions of the relative importance of the Key Performance Areas (KPA) of the value hierarchy and their constituent attributes (Chatzkel, 2002; Pike et al., 2002) (fig. 1).

Source: Guthrie (2002)

Figure 2. The ARCBS value hierarchy

As a result of the study, ARCBS is better able to visualize the value creation path and may better align performance measures and strategy to achieve greater value creation.

In 2009, Guthrie et al. came back to analyze the ICRs of ARCBS in the 2002-2005 three-year period to provide an assessment of ICR in a NPOs through the content analysis methodology (Guthrie et al., 2004). It was found that, unlike prior studies on corporate ICR, the amount of IC reporting at ARCBS is generally high, especially for certain IC elements (the reference is to the high incidence of innovation and R&D). Summarizing, ARCBS is an organization that has focused on and expended considerable effort on developing a stakeholder oriented IC report, but the IC reports do not trace the process of value creation through R&D or, more generally, through IC (Guthrie et al., 2009).

Intellectual capital provides an overview of potential future NPOs its ability to compete in the market, highlighting the strengths and weaknesses to be maintained to be corrected to avoid crisis situations.

IC helps to shift NPOs strategic focus to intellectual resources including knowledge, skills and experience. This is important to NPOs because strategic activities and changes

that are brought to the organisations will be mainly driven by internal initiatives by paid employees and volunteers rather than external forces such as government agencies

Mouritsen et al. (2005) emphasise that IC is related to questions about identity, such as 'who you are, and what you want to be' and thus, IC is not merely an objective in relation to intellectual resources, but is an identity crafted around ability and knowledge of what an organisation can do (Mouritsen et al., 2005; Roos et al., 1997). As a result, the IC approach forces non-profit leaders to rethink their mission and their social *raison d'être*. IC becomes important to NPOs not only because it helps the organisations to avoid goal displacement and resource diffusion, but it assists them to refocus their objectives on the social dimensions, which are sometimes distorted by operating in commercial contract environments under the public sector reform movement.

The representation intellectual capital has been widely tested in the world of private enterprise, a field in which you can find numerous studies, but is poorly implemented at the NPOs. Nevertheless, the reasons for that postulate the management in these companies are similar to those of companies: user involvement in the processes of production / service delivery, high professionalism of the operators, direct contact between the applicant's performance and who the supplies, etc.

4.1 Characterize of CSV in the NPOs

The components that characterize the intellectual capital in the NPOs can be classified into three categories:

1. Human Capital consists of the knowledge, skills, knowledge, experience, skills that are embedded in the human system of NPOs. It is a capital that cannot be owned by anyone outside of the person who owns it. Therefore, to maintain some success for each NPOs is necessary for the to take action to motivate and involve volunteers to enforce their involvement with the NPO on which operate. The ability to attract and retain competent and motivated people, more efficiently than the organization for profit, represent the principal source of competitive advantage. (Mauritsen and Larsen 2005). As far as possible is important to convert human capital into structural capital through the sharing of expertise and experience

2. Organizational Capital, expressive of knowledge possessed by the structured and shared (database, procedures, software, manuals, etc..) from which springs the corporate

culture and with whom it describes the modus operandi of the NPOs, consists of all those elements, tangible and intangible, that support volunteers in their job.

In particular, the organizational structure and operating procedures represent the reference frame for the proper functioning of a company, since they define the subdivision of activities and the exact methodology to be used in the work performance (Joia, 2000).

3. Relational Capital, represented by the set of relationships that develop between the NPOs and the local community of reference (individuals, associations, businesses and other stakeholders that will work with the agency. From these reports resulted in a number of different intangible. Consider, for example, reputation, credibility, the social consensus and so on.

A NPOs creates a competitive advantage when it focuses on creating value for the user, that is to say the ability to produce wealth for the user itself (Cavenago, 2004). In the NPOs, relational capital covers, among other aspects, the communication system, client satisfaction, feedback and the corporate image (Andriesson, 2008). The communication system is important because the NPOs must have a deep understanding of the user's needs and, therefore, must create a relational and communication system that is able to perceive in real time the changes in demand; if it does this successfully it will be able to create an effective service and build up client loyalty and goodwill.

It needs to manage all three components of intellectual capital in the world only unit so it triggers a virtuous cycle that leads to an increase in the knowledge that, in turn, is a source of value creation for every NPOs.

Peppard and Rylander (Peppard and Rylander, 2001b) argue that IC resources can be utilised simultaneously by many users in different locations at the same time and thereby, are non-competitive in an economic sense. The non-competitive characteristic of IC is important to NPOs because IC may encourage resource sharing rather than resource competition

5 Methodology

5.1 Introduction of CSV

The CSV - Centro Servizi per il Volontariato (Voluntary service centre) – it is a NPO created on the indication supplied by the law on volunteers organization (L.266/91) and it is managed by Volontà Solidale, which is an association of no profit association that has the role to sustain, promote and develop voluntary activity in Italy. In 2010, the shareholders were 9.409, with an average of 121 shareholders for CSV. In Calabria, there are 481 shareholders, with an average of 96 for each centre.

5.2 Historical reasons for the CSV

Cosenza CSV, financed from **Special fund for Volunteers**, works since 2003 with basic principle “help” and “empowerment” to promote an active role of citizens in building an equal society and to guarantee the common wealth. It gives value to volunteers and enable people of Cosenza area to be volunteers. In march 2014 is operating with 16 workers. During 2013 were recorded to Cosenza area CSV 608 *NPOs*. The board is formed from 21 members which meet 7 every year.

Can use and receive services CSV the following subjects:

1. Volunteers NPOs which work in the area and single volunteers who works in NPOs' as well;
2. Volunteers network;
3. Single persons who want to establish a volunteer's NPO;
4. aspiring volunteers;
5. Citizens who want to be involved in the promotion of a culture of solidarity;
6. Subjects of the Third Sector and public bodies who can provide information and guidance on issues relating to volunteerism.

It is clear, therefore, that the CSV supports the practical world of Volunteering through the provision of a number of different services; from basic services, promotion, advice and professional assistance, services, training, documentation, communication and social planning. (table 3).

Table n. 1 – CSV main services

Hearing/Orienteering:	Advice:	Logistic
Citizen	Social meeting	Advertising
Association	Associations' meeting advice	Rent instrumental assets
Hearing	General advice	

Source: our elaboration

CSV at 31/12/2012 filed 1.300 NPOs' in Cosenza area; among these

- 584 are related to law 266/91 (Volunteers' NPOs);
- 432 Volunteers' NPOs which work with CSV;
- 311 recorded in the regional volunteers NPOs register;
- 250 work with CSV among the recorded in the regional volunteers NPOs register.

5.3 Research Framework

The research is in two parts: first is theoretical on NPOs' characteristics and analyses organizations and dimension using most recent national census Istat; then IC is applied to NPOs' world. Second part is empirical: it analyze a case study and elaborate a new IC framework (Cfr. Attach n. 1)

The second part has two steps. First of all, is made a quantitative analysis on IC report available on line for NPOs and particularly for Volunteers' NPOs. From on line data clearly results a very little number of NPOs which disclose intangible report in general and IC report in particular. IC management is almost unknown among Italian NPOs: according to the literature, in Italy there have reported only been two cases of NPOs which have assessed their IC (Bronzetti and Veltri, 2007). For this reason we read IC report of for profit organization as well which indicators can be estrapolated and implemented to represent and improve *NPOs* communication. On these basis we have built a new IC framework with indicators of the three IC areas: Human capital, structural capital and relation capital still divided in growing indicators, efficiency and stability indicators. CSV of Cosenza province was chosen as case study as was necessary to get objective information on service supplied and social impact on the NPO examined. CSV is a benchmark for all NPOs operating in the area; to implement a new IC framework in CSV of Cosenza provincia could facilitate the adoption of the instrument in the area. The

new IC framework is set on the basis of the Sveiby *Intangible Assets Monitor*, already adopted in other structures.

Table n. 2 – IC Indicators

	HUMAN CAPITAL	STRUCTURAL CAPITAL	RELATIONAL CAPITAL
GROWTH AND RENEWAL SKILLS	Availability of the personnel to enhance their skills and from CSV to supply resources for he growth	CSV skill to generate new services	CSV skill to keep its users and to get new ones
EFFICIENCY	Skill to create new value	Innovation skill with the minimum number of resources	Customer satisfaction
STABILITY	Measure personnel loyalty and membership to CVS	Trust of the internal personnel in the structure	Measure the retention of old users

Source: our elaboration

5.4 Scope of the research

A new framework to be used from all NPOs. The new IC framework represent main tool for *NPOs* to aid strategic planning of the knowledge, internal and external, communication with stakeholders about services offered and resources available. Past studies on *NPOs* showed the awareness and the perceptions of non profit sector regarding IC is not diffuse (Schneider and Samkin, 2008; Guthrie et al., 2009).

The non profit sector records a delay in the awareness on the strategic relevance of IC to create and manage knowledge to enhance organizational value and the lack of specific IC management models tailored on non profit organizations.

Until now, researches and studies on IC have been mainly developed and used by for-profit organizations. Fewer were focused on non-profit organizations (NPOs), in spite of the fact that since the early 1990s NPOs stand out as crucial actors in politics, economics and welfare systems (Salamon et al., 2003). Kong (2007a, 2008) suggests that IC can be applied as a conceptual framework for effective strategic management of NPOs, since it does not have an economic nature and shifts strategic focus to intangible resources.

5.5 Hypotheses testing

IC can be an effective tool for NPOs and, for CSV best suits its resources and products because it addresses intangible assets, which are the most important resources for NPOs. We hypothesize that Italian CSV (as most NPOs) do not use IC, but they might highly benefit from using it to address their management challenges. In particular, the following questions are examined:

- (1) Which intangible resources are highlighted in the operations del CSV ?
- (2) What are the existing practices regarding the managing of IC factors da parte del CSV?
- (3) What are the IC needs of management in these organizations?

The aim was to gain from the informants a more concrete and detailed understanding of the role of IC in these organizations and the needs to manage IC. Follows an exam of the most important.

5.5.1 Human capital (HU)

HC in CSV is the most important and strategic asset of the organization. The set of persons with their skills is steady in the years analyzed.

Referring with availability growth and innovation indicator there are 13 workers. Their profile is young, dynamic and with a good culture (graduated 11). There are more women than men with a good instruction. An important indicator shows the training days and it is constant in the two year examined. In front of the training provided it was not considered necessary to develop new roles or introduce training programs for new hires. The organizational roles may be considered consolidated. In addition, in 2013, there was a growth trend in the training courses organized in the area and a large presence of volunteers involved and interested in it. These indicators are a practical reaction to the needs of the territory and NPOs in the light of ongoing changes.

With reference to the efficiency indicator it can be highlighted an involvement of employees in the various fields of activity of the CSV and also a good network capability that helps to build a positive image of the organization which contributes to the achievement of a high level of satisfaction of the parties that are addressed to it.

With reference to the stability indicator the average age both of the Board and the staff present a trend very young. The presence of staff is most prevalent in the agency and in the communication than other areas. Positive results have emerged on the level of customer satisfaction of staff in relation to their working conditions. The analysis

conducted can be deduced also a high sense of belonging and a strong personal identification with the CSV. This ensures stability in time. The indicator shows the strengthening of the capacity of CSV to foster a positive climate that encourages business development both in the design phase and service delivery. An associative favorable climate provides more guarantees in terms of fidelity and correct behavior by individual members.

Table n.3 - Human Capital indicators

	Year 2012	Year 2013
Employees	13	13
Part-time	13	13
Growth and renewal capability		
With degree	11	11

CSV experience	8	8
<i>(scala 1/5)</i>		
Customer satisfaction	5	5
NPO loyalty	5	5

5.5.2 Structural Capital

The Structural capital represents the set of tools and skills, technology innovation that enable the CSV to optimize organizational processes. It includes all the features that go beyond the individual and are placed at the service of each of the CSV and professionalism that it is aimed to obtain quality services.

With reference to the growth and renewal availability indicator it can be report a decrease in 2013 of meetings held; attendance at meetings, however, the attendance has been constant especially by members. With reference to the efficiency indicators, there has been an increasing trend with an average of the services provided to the urban area higher than the other territories under its jurisdiction. There is also an increase in revenue from the Special Fund for Voluntary Service (See table 8) for grants handed out by public bodies to be zero in 2013. Indicator of the shares is embedded expression economic quantification in line with the trend of n. of the member organizations and allows us to highlight the sustainability quality of the services rendered by CSV. The value of units underwent a slight decline.

The indicator growth and availability to renewal there is a decrease of the meetings even if attending at the meeting is constant from shareholders. Efficiency indicators there is an increase of the urban area.

Table n.4 – Structural Capital Indicators

	Year 2013	Year 2012

Social report	1	1
Mission report	1	1
Service card	1	1
Guidelines	1	1

5.5.3 Relational Capital

Relational capital represents the heritage of CSV made outside of relations established inside and outside the structure. It expresses the result created by the use of intangible assets relating to both the structural capital to human capital. The analysis of the indicators of relational capital shows the ability and aptitude of the CSV to produce positive results.

For the indicator growth and availability to renewal there a steady increase in the various urban area. The number of services provided is in remarkable growth and shows an increase in services provided through personal contacts. It should be noted , moreover, in the course of 2013 a number of access to the site with a very high increase of contacts on social networks. This demonstrates the willingness of the CSV to engage and cultivate the interest of various age groups especially the younger ones . These indicators (increased telephone contacts managed in detail and contacts via the web) confirm the continued efforts of the CSV oriented to the improvement of communication (even more targeted and personalize) with the aim to achieve a constant level of sharing of experiences and knowledge. The indicator is significantly stable and with the growth trend .

To underline the highest number of seminars in 2013 compared to 2012 with a high participation of volunteers. It is clear , moreover, a number of issues in the media constantly growing. This confirms the ability of the CSV to approach the issues close to the collective with the aim of raising public awareness. These indicators give greater visibility to CSV and its commitment to the territory.

With regard to the indicator efficiency , many positive judgments (internal and external) that have an impact on the company image . There is also a growing trend with regard to the collection through the 5 per thousand. Finally, with reference to the indicators of stability suggests a spatial distribution that correlated with the number of residents expressed a degree of attraction of the CSV similar in different geographical areas . This is the manifestation of vitality and stability of the CSV fact that although different even between the same purpose . The indicator in question confirms in terms of miles the increased need of the community and the continued demand of services by the whole territory.

Table n.5- Relational Capital Indicators

	Year 2013	Year 2012
Growth and availability to renewal

Organizations Ionio area	156	
Organizations urban area	190	

6 Results of Hypothesis testing and limits of research : a concluding summary

The NPOs vary across countries and the sector has profoundly changed in recent year.

The IC approach seems well-suited as a managerial framework that can capture the intangible aspects of operations of NPOs. However, more research and practical application experience are needed at this stage nowadays in Italy as most european countries NPOs have equally important economic as well as social dimensions and it happens especially in the welfare services social sevicees and health care. the future scenario is for a further increasing of the sector. (Borzaga C., Fazzi L., 2011).

The new IC framework proposed contained the argument that Human Capital, Structural Capital and Relation Capital are all resources and, as such, each offers a potential avenue for competitive advantage. The suggestion of a conceptual new IC framework such as the one in this paper represents a significant addition to our understanding importance IC within the context of NPOs. The framework of this IC

report is proposed as a method of more fairly, objectively and transparently identifying the hidden value of the CSV and also all NPOs.

The new IC framework compiled by CSV in the province of Cosenza is a tool that can bridge the information gap and anchor the strategic objectives of the CSV to the objectives of the individual NPOs to it in turn. Through the new IC framework CSV has been able to: Identification and mapping of the intangible asset;

- Increase understanding of how the interrelationship of people knowledge can create;
- Improve workers' personal perception of the organization which leads to increased motivation to work;
- Create a culture of performance improvement oriented;
- Better understand the flow of knowledge within the organization.

The new IC framework is intended by CSV of Cosenza as a management tool that allows you to monitor the evolution of relations between the CSV and the community ; increases the diffusion of knowledge within and outside if properly used and allows a transparent communication with all stakeholders of the performance and organizational skills. The new IC framework is seen as a means of fund raising, raising of financial resources and people raising, recruitment of new volunteers , but also as a tool to create greater involvement of people already in contact with the CSV and the consolidation of the reasons in the founders and the members. Therefore , report through the new IC framework of intellectual capital CSV is a strategic factor for design along with NPOs that are addressed to it in the future and broaden the base of resources, both human and financial .

The continued commitment to the development of the IC, the sharing of Knowledge CSV through the use of media, training initiatives allow a constant involvement of citizens and volunteers with the growth of their skills they acquire a greater awareness in the social . The knowledge acquired over time both allow a reduction in the social cost borne by the community and is an increase in the level of safety of the users in contact with the CSV .

Through the new IC CSV framework aims to standardize the display mode of the intangible resources through their grouping into the three dimensions of IC (human capital , structural capital , capital relation) and subdivided into indicators of growth and renewal , performance indicators and indicators of stability.

IC is an important resource that CSV need to develop in order to gain sustained strategic advantages. This work helps to build a nascent body of literature suggesting that IC can be utilised as a competent strategic management conceptual framework in all NPOs. The increased awareness of the IC concept in NPOs, as a result of this paper, likely generates further research

Unlike many other for-profit strategy concepts, IC stresses qualitative, non-financial indicators for future strategic prospects and may be harnessed to co-ordinate with the unique environment in which NPOs operate. IC contributes the CSV strategic positioning by providing enhanced understanding of the allocation of organisational resources. Simultaneously, IC enables to CSV to enhance their performance by providing meaningful information to organisational stakeholders. In these ways, IC aids the organisations in their attempts to reconcile their social and commercial objectives

IC framework helps to shift the focus towards strategic CSV intellectual resources including knowledge, skills and experience through their constant monitoring. The sharing of knowledge management tools and knowledge allows the improvement of the effectiveness and efficiency of the services provided and improved organizational stability CSV to guarantee the new challenge for the development of strategic knowledge.

The IC framework requires little interpretation , when used and disseminated within and outside the CSV encourages the sharing of resources rather than competing for resources . This is because due to a change in behaviour and values of the people of what is good and what is bad for the organization of what is right and what is wrong to do .

The results of the empirical study are limited only by the CSV object of IC implementation of the new framework. Therefore Although the work Reaches concrete results, the presence of a single CSV object of analysis reduced and limits Their significance.

Structured Abstract

Purpose – In the last years, researchers have shown that innovation processes are veering towards an “open innovation” approach whereby innovating firms rely increasingly on contributions by external partners (Chesbrough, 2003). In particular, the automobile manufacturing industry is a typically complex technical environment where the cooperation in knowledge creation is very extensive (Lin and Cao, 2012). On these basis, this paper aims to analyze if and to what extent, innovation output in terms of patent quantity and value differs depending on whether an automaker engages in a (certain type of) collaboration for its R&D activities.

Design/methodology/approach – To reach our aims, we selected a quali-quantitative approach based on the collection of two datasets about four among the world largest automakers: the former contains a total of around 4,400 relationship pairs of automakers and suppliers, allied companies and subsidiaries; the latter includes the automakers’ EPO patent portfolios, and related information, since 2004 which provide the names of the co-assignees. Matching the company names of the two data sources allowed us to obtain the final dataset used to carry out the extensive descriptive analysis and regression analysis.

Originality/value – The paper contributes to the scientific literature by investigating the presence of differences across the patenting activities of a selection of automakers and their supplier, allied and subsidiary firms. Moreover, the issue related to patent value represents an emerging area of interest in the field of collaborations for innovation. Also the methodology constitutes a novelty in this field, since the examined database is generated by matching two different sources. Furthermore, the process for cleaning and standardizing the company names (“name game”) combined an automated algorithm with a double manual check, by searching the company websites and querying the corporate tree.

Practical implications – The outcomes of the study show that the four selected automakers adopt different strategies regarding co-patenting with their R&D partners. On this basis, a framework including four main strategies -contingent, purposive, watchful and advanced- have been identified and lays the foundation for further research in this field. In addition, the present study reveals that co-patented inventions with suppliers and subsidiaries seem to be more valuable than with allies. Evidences emerging from our paper may support firms in making aware choice regarding the management of knowledge collaborative activities and co-patenting.

Keywords – Co-patenting, R&D collaboration, Suppliers, Alliances, Automotive

Paper type – Academic Research Paper

1 Introduction

In contexts characterized by increasing competition, constant innovation is a primary source of sustainable advantage (Chesbrough, 2003). Importantly, innovation has become a collaborative activity and firms rely extensively on their environment to exploit much of their innovation advantage (Fawcett *et al.*, 2012).

On these grounds, the issue of how to manage the knowledge flow in and out of a company has become a major corporate concern (Choi *et al.*, 2004) and R&D collaboration has been given increasing attention by researchers (Lin *et al.*, 2011). In this field, the literature has mainly focused on ‘why to cooperate’ and ‘with whom’ (Schwartz, 2012), as well as on the impact of (different types of) R&D collaboration on firm performance (Hottenrott and Lopes-Bento, 2012), both in terms of innovation output and economic output. Within this context, where it is widely recognized that patents are among the most important outcomes of R&D (Laursen and Salter, 2006) and intellectual property (IP) management issue becomes central in order for firms to protect their competitive position (Reitzig 2004), patents could be exploited as data source for the investigation of co-patenting strategies and the value of R&D collaboration output.

Based on these evidences, this paper aims to analyse if and to what extent innovation output, in terms of patent quantity and value, differs depending on whether a firm engages in a (certain type of) relationship with its R&D partners in the automotive industry which is a typically complex technical environment where the cooperation in knowledge creation is noteworthy (Lin and Cao, 2012). On this basis we mean to identify possible co-patenting strategies between automakers and their R&D partners. In particular, this study investigates the phenomenon of co-patenting from the perspective of the type of

relationship existing between the focal firm and its R&D partners, that are suppliers, allies and subsidiaries.

To reach our aim, we opted for a quali-quantitative approach. Four global-scale automakers were selected and for each of them we identified both the portfolio of relationships with supplier, allied and subsidiary companies and the portfolio of patented inventions co-owned with other firms.

Results show that the selected companies seem to have different co-patenting strategies not only in terms of propensity to co-patenting but also in terms of relatively most frequent type of partners and of level of concentration of the co-owned patented inventions with them. We argue that co-patenting strategies can be thus distinguished along the categories *contingent*, *purposive*, *watchful* and *advanced* according to the co-patenting propensity and the presence of a preferred co-patenting relationship type, i.e. suppliers, subsidiaries or allies.

Moreover, the co-owned innovations are on average more complex, are associated to a wider technological scope and cover technological fields which are more often different from the core activities of the examined firms than the single-owned inventions. Finally, the technological relevance of the patented inventions is higher when the co-assignee is either a supplier or a subsidiary. The results seem associated to the fact that firms might be more able to generate valuable innovations collaborating with partners with a tighter relationship correspondent either to the direct ownership or the existence of a solid supply contract, while co-patented inventions deriving from alliances, that is the R&D collaboration output, may be required by the alliance agreement.

The remainder of the paper is divided in four sections: firstly, a literature overview on R&D collaborations and involved partners is outlined in order to contextualize the research questions; secondly, the methodology is described in deep details; thirdly, data analysis and results are divided into two parts, among which the former provides a thorough descriptive analysis and the latter a statistical analysis; lastly, results are discussed in order to draw the conclusions and open new paths for future research.

2 Theoretical background

2.1 R&D collaboration and co-patenting

Technological innovation has been the driving force for evolution in many industries. The success or failure of a firm's R&D activities often has serious implications for its overall performance (Teng, 2007), hence firms have allocated increasing resources to R&D to speed up the pace of innovation and diversify their technological capabilities (Miotti and Sachwald, 2003). One of the most successful and widely employed approaches has been a cooperative strategy. Within this context, Chesbrough (2003) suggests that many innovative firms have shifted to an 'open innovation' model, using a wide range of external actors and sources to help them achieve and sustain innovation. This concept redefines the boundary between the firm and its surrounding environment, making the firm more porous and embedded in loosely coupled networks of different actors, collectively and individually working toward commercializing new knowledge (Laursen and Salter, 2006). In particular, joint R&D is one of the most significant driver towards collaboration in medium and high-tech industries.

Tether (2002) illustrates that R&D collaborations have a long history and they received considerable theoretical and empirical attention during the 1980s and 1990s when authors started to talk about strategic technology alliances, collaborative arrangements for R&D, and innovation networks.

Scientific literature on the theme of R&D collaborations has developed along two main streams of research: the first concerns the various motives that spur firms to collaborate on R&D (e.g. Fritsch and Lukas, 2001; Tether, 2002; Belderbos *et al.*, 2004a) and the second studies the effects of (different types of) R&D cooperation on firm performance (e.g. Belderbos *et al.*, 2004a,b; Gnyawali and Park, 2011).

In particular, a variety of reasons are given in the literature for the apparent growth in innovation and technology alliances: to overcome firm individual limitations in R&D capabilities and enhancement of their R&D success rate, as well as to jointly endorse R&D outputs, which creates a network externality effect that increases the innovations' chance for market acceptance (Teng, 2007), and reduce the risks associated with innovation, including the risk of technological spillovers (Tether, 2002).

Concerning the second stream of literature, firm performance may refer to the generation of new innovation or to the associated economic returns. The latter are measured in terms of sales, employment growth and firms labor productivity (e.g. Klomp

and van Leeuwen, 2001; Lööf and Heshmati, 2002; Faems *et al.*, 2005). The former is related to the increase of firm capabilities in terms of new product development, R&D project performance, technological advances and patent productivity (e.g. Brouwer and Kleinknecht, 1999; Gnyawali and Park, 2011; Sampson, 2005). Reminding that there is a well-established relationship between R&D and patents (see Griliches, 1998), and patents are among the most important outcomes of R&D (Laursen and Salter, 2006), we expect an association between the joint R&D efforts of firms and joint patenting.

A co-patent is a patent owned by two or more assignees, hence co-patenting implies the joint ownership of collaborative outcomes (Belderbos *et al.*, 2013). Co-patenting started to become a more diffused practice towards the end of the twentieth century when jointly owned patents tripled within a period of only ten years (Hagedoorn, 2003). From an economic perspective the joint ownership of patents creates, depending on the number of proprietors, a form of duopoly or tight oligopoly that appears at first somewhat similar to a restrictive licensing agreement (Hagedoorn, 2003). Despite studies (e.g. Reitzig and Wagner, 2010) stress the disadvantages of co-patenting, Belderbos *et al.* (2013) noted that co-ownership of intellectual property (IP) remains an empirically relevant strategy for companies developing technology jointly. Moreover, Hagedoorn *et al.* (2003) provided evidence that firms engaged in co-patenting activities in the past are more likely to adopt co-patenting with subsequent collaborative activities, which suggests that the learning experience of effectively arranging and managing co-patents makes firms more likely to employ them in subsequent collaborative efforts (Belderbos *et al.*, 2013). The type of partners involved in co-patenting seem to be one of the focus of co-patenting. In particular, previous literature (e.g. Tether, 2002; Miotti and Sachwald, 2003; Belderbos *et al.*, 2013) focus on four main categories of partners: suppliers, customers, competitors and universities or research institutes.

Assuming a different perspective, in this study we aim to investigate the differences in the co-patenting activities of a set of automakers, which represent our focal firms, according to the type of relationship with the co-assignee. Indeed, the choice of the governance mechanisms –from arm’s length market transaction to strategic partnerships– appears to be key in order for automakers to access external specialized knowledge while avoiding issues of partner’s opportunism, knowledge leakage, and appropriability (Trombini and Zirpoli, 2013). The whole study is integrated in the automotive industry which is a typically complex technical environment where the cooperation in knowledge

creation is very extensive (Lin and Cao, 2012). In particular, large automakers proved to be among the most active in co-patenting (Hagedoorn, 2003). More generally speaking, the automotive is a technology-driven sector which makes high use of patents in order to prevent imitation by competitors. Furthermore, due to the enlargement of the car's technological components (e.g. electronics components) and the rise of new technological trajectories (e.g. the «electrification» trend), automakers have been increasingly needing to master a wide variety of technological fields in order to stay at the forefront of technological developments (Trombini and Zirpoli, 2013). Due to the distinctive features of the context of analysis, which are detailed in the Methodology section, as anticipated this paper offers an alternative perspective which takes into account the type of relationship a firm has established with partners it collaborates for innovation with. In particular, we focus on collaborative R&D between the focal firm and their suppliers, allies and subsidiaries.

2.2 R&D with suppliers, allies and subsidiaries

Collaboration with suppliers is highly important in the automotive industry, to the point that the success of Japanese automakers has been attributed, amongst other factors, to their close supplier relations, with suppliers being closely involved in the innovation process (Harhoff *et al.* 2012). For example, Toyota has developed a number of practices that facilitate knowledge transfer to and among suppliers with whom it has developed its innovations. However, the fact that vertical co-operation is supposed to impact more on the introduction of new products to the market than on patenting (Miotti and Sachwald, 2003) suggests that further analyses are required.

The second relationship type for R&D collaborations deals with a firm's alliance partners which are, in many cases, the most important source of new ideas and information that result in performance-enhancing technology and innovations (Dyer and Singh, 1998). Indeed, partners may bring distinctive resources to the alliance, which, when combined with the resources of the partner, results in a synergistic effect whereby the combined resource endowments are more valuable, rare, and difficult to imitate than they have been before they were combined (Dyer and Singh, 1998). Thus, alliance partners can generate rents by developing superior inter-firm knowledge-sharing routines, where inter-firm knowledge-sharing routine is defined as a regular pattern of inter-firm interactions that permits the transfer, recombination, or creation of specialized knowledge

(Grant, 1996). Joint R&D is one of the most popular reasons for forming alliances in many so-called high-tech industries and emerging technical areas (Hagedoorn *et al.*, 2003). Based on the fact that an alliance is defined as voluntary agreements between two or more organizations that unite to pursue a set of agreed-upon goals remain independent subsequent to the formation of the alliance (Rangan and Yoshino, 1996), the choice to share property rights may be seen as an important landmark signifying the successful completion of inter-firm cooperative R&D and a milestone suggesting future collaboration as the discovery is moved toward commercial success (Hagedoorn *et al.*, 2003). Moreover, seeing the benefits of a long-term partnership is crucial for entrepreneurial companies before engaging in risk-taking behavior such as the disclosure of sensitive knowledge. Hence, we argue that R&D alliances offer a fertile soil for patenting.

Lastly, firms consider that co-operation within groups involving subsidiaries does indeed constitute co-operation which needs to be considered as a separate case (Miotti and Sachwald, 2003). Indeed, in this case competitive risks are *a priori* much lower, which may for example be an incentive to co-operate also for relatively small firms and to patent. Despite these indications, previous literature in this field (e.g. Tether, 2002;) has mainly focused on the propensity of ‘group firms’ versus independent firms to have co-operative arrangements for innovation with external partners, rather than on patent sharing between the focal firm and its subsidiaries.

Within this context, to the best of our knowledge, there is no study investigating patterns of co-owned patented inventions depending on the type of relationship between the focal firm and its patent co-owners/R&D partners. On this basis, the first research question emerges.

RQ1: How does the co-patenting strategy of automakers differs according to the type of relationship with the R&D partners?

Previous empirical studies found evidence for a positive effect of R&D collaboration on innovation output, often measured in terms of the number of patents, while the characteristics and the value or technological relevance of these patents has not been studied to the same extent. Only a few authors have expanded on this topic, finding that joint R&D may provide incentives to file patents that are indeed aimed at protecting

valuable inventions from imitation by others, while exchange alliances drive ‘portfolio patenting’ which has been shown to result in fewer citations for the individual patent (Hottenrott and Lopes-Bento, 2012) and, in any case, the challenge to appropriate value from sharing IP ownership depends on the type of partner involved, with particular emphasis on intra-industry vs inter-industry dynamics (Belderbos *et al.*, 2013).

The literature offers a variety of indicators based on patent bibliometrics to estimate the characteristics of the underlying inventions such as the complexity, the technological and geographical scope of the protected inventions (e.g. van Zeebroeck and van Pottelsberghe, 2011). In particular, the technological importance of the patented invention can be assessed through the number of citations received from subsequent patent filings (forward citations). The issue related to patent value has received increasing attention since it has been recognized that the economic value of patents is skewed and only a small percentage of patents is truly valuable (Scherer and Harhoff, 2000).

Based on these considerations, the second research question is formulated.

RQ2: How do the co-assigned patented inventions differ from single-owned ones and which are the most valuable when considering co-patenting between an automaker and its suppliers, allies and subsidiaries?

We refer to the output of joint R&D in terms of patents assigned to more than one company as “co-owned/-assigned patented invention” since our unit of analysis is the invention underlying the patent documents: the next section provides details on such issue.

3 Methodology

Our study is made up of two parts; the first has an exploratory nature aimed to investigate patterns of co-patenting between automakers and suppliers, allies and subsidiaries; whereas the second is explanatory and aims to determine which are the characteristics of the examined co-patents in terms of technological scope, complexity and technological relevance. As a consequence a multi-method approach has been selected. In particular, the first research question is addressed through a qualitative analysis based on multiple case study, while the second research question is addressed

through a quantitative analysis based on econometric regressions comparing pairs of single-owned and co-assigned patented inventions.

3.1 Case selection

Cases were selected based on the following criteria. Firstly, automakers had to be parent companies because this allowed to build their corporate tree which was needed in order to identify subsidiaries. Secondly, the top countries in terms of motor vehicle production were considered, namely U.S., Japan and Germany¹. In these countries, the top performers are General Motors, Toyota and Volkswagen. However, since General Motors could not be included in the sample², we opted for the second US automaker which is Ford. Due to the smaller size of Ford, we considered more appropriate to include in the sample another smaller, though relevant, automaker, which then revealed interesting since it contributed to diversify the co-patenting strategies. We opted for the second German automaker, which is BMW, so as to have two European and two non-European companies. Table 1 shows the main features of the selected cases.

Table 1 Main features of the selected cases (data from CIQ)

<i>Automaker</i>	<i>Acronym</i>	<i>Year of foundation</i>	<i>HQ Country</i>	<i>Total revenues 2012 [M€]</i>
Bayerische Motoren Werke AG	BMW	1916	Germany	76.848
Ford Motor Co.	FRD	1903	United States	101.823
Toyota Motor Co.	TTA	1933	Japan	192.295
Volkswagen AG	VLW	1937	Germany	192.676

3.2 Data collection

We collected two sets of data for the four selected automakers from two proprietary databases, Capital IQ (CIQ) and Thomson Innovation (TI)³. We then matched the collected information by exploiting the fact that focussing on a relatively small sample of companies allows a more detailed check of the data, in particular on firm names.

¹ China is one of the most relevant countries concerning the automotive industries, however, information on names of Chinese companies, in terms of corporate structure and patent assignments with the company names, are not complete and clear, thus we deliberately decided not to consider it.

² In 2009 General Motors went through the Chapter 11 re-organization which could have caused problems in the process of identifying subsidiaries before and after that year, as well as in the matching with assignee names (see Data collection for further details about this issue).

³ All data were accessed in October 2013.

From the first dataset, CIQ, we retrieved the inter-firm relationships in the groups of supplier, allied and subsidiary companies, for a total of around 4,400 relationship pairs⁴.

From TI, we derived the automakers' patent portfolios at the European Patent Office (EPO) and the names of the co-assignees. The focus on the EPO is motivated by reasons of data uniformity, integrity and reliability, as suggested also by Belderbos *et al.*, 2013. Moreover the EPO is a regional office so it should suffer less from the domestic effect of applicants filing their invention more often in the country of their headquarters (Criscuolo, 2006). We collected all the EPO filings with earliest priority year from 2004. The choice of the priority date as reference is consistent with the analysis based on inventions rather than patents since it is the closest to the invention date. The process generated a total of 13,576 patent documents.

With the aim to avoid the double-counting of the patent protected inventions and to consider the invention described in the application document and in all the corresponding subsequent published patent documents (e.g. search report, grant, potential amendments...) as a single unit of analysis, the retrieved documents were collapsed on the application number itself, operatively by grouping the records on the publication number and excluding the publication kind code. Such procedure determined the measurement of the inventive activity with a more accurate proxy than the count of patent documents.

The final collected records correspond to 8,041 inventions and the total share of co-assigned patented inventions is 17.5%: Table 2 provides details for each automaker.

Table 2: Descriptive statistics regarding patents

<i>Automakers</i>	<i>EPO patents (priority year >= 2004)</i>	<i>Patented inventions</i>	<i>Number of single-owned patented inventions</i>	<i>Percentage of co-owned patented inventions</i>
BMW	2,116	1,248	1,012	18.9%
FRD	1,459	912	821	10.0%
TTA	8,808	5,131	4,174	18.7%
VLW	1,193	751	627	16.5%

⁴ Some of the identified partner firms are listed with two of the three or with all the three statuses at the same time. Additional information on the data collection process are available on request.

The process of matching the two different data sources started from the standardization of the company names, in order to keep note of spelling mistakes, of historical brand changes and of mergers and acquisitions whenever possible. Such task was accomplished by analysing all the names of the identified patent co-assignees (about 2,000) at first by applying an automated algorithm for grouping similar names which served to overcome spelling variations and department specificities mainly. Secondly, we manually checked the results by comparing and, when needed, integrating them with internet searches on the official company websites and with companies' corporate tree available in CIQ. The procedure ended up with 529 different assignee names⁵.

The final procedural step is constituted by the matching between the standardized assignee names from TI and the company names retrieved from CIQ as supplier, subsidiary and allied firms of the selected automakers. A total of 121 assignee names (23% of the standardized company assignee names) were matched to CIQ lists.

3.3 *Statistical model*

The second set of analyses consists of two types of econometric models aiming at exploring the differences and commonalities across the automakers' portfolios of co-owned patented inventions output of collaborative researches: i) a set of probit models on the co-assignment likelihood to highlight the presence of differences between single owned inventions and those output of R&D collaboration; ii) a set of maximum likelihood treatment-effects models to ascertain the technological relevance level, measured by patent citations, of the inventions generated collaborating with suppliers, allies and subsidiaries.

The first group of econometric tests investigates the patent-level characteristics of the co-assigned inventions through a probit model on the co-assignment likelihood. The dependent variable of the probit model is a dummy for the co-assignment, equal to 1 when the invention is owned by more than one firm. It describes the differences between single-owned and co-assigned R&D output at the level of invention characteristics. In line with existing literature (van Zeebroeck and van Pottelsberghe, 2011), we employed the available patent bibliometric indicators as independent variables which serve as proxies for: complexity (number of backward patent citations and of inventors) and technological

⁵ Individual assignees were excluded from the standardization process and the analyses.

scope (number of diverse International Patent Classification codes at four digit level or IPC subclasses). In addition to the latter indicator which provides information on how many different technical fields the invention is associated with, we computed a dummy variable equal to 1 when the patented invention reports specific IPC codes related to the main technology fields of activity of the corresponding automaker. To do so, we identified the core technologies in each automaker from the analysis of the most representative IPC classes associated to the single-owned inventions in each company's portfolio⁶. As a robustness check, we controlled for automakers and years dummies.

The second group builds upon the findings of the correlation from the previous probit model to estimate, through a treatment-effects model, the presence of differences in the technological value of the co-assigned patented inventions according to the type of relationships with the R&D partner. The maximum likelihood treatment-effects model (Wooldridge, 2002) considers the effect of an endogenously chosen binary treatment, in this case the invention co-assignment rather than being a single owner, on another endogenous continuous variable, the technological relevance of the invention, conditional on two sets of independent variables. The technological importance is proxied by the number of forward citations, weighted in order to keep consideration of the filing age. The treatment equation replicates the previous probit model while the second stage equation includes the dummies for the relationship types with the co-assignees (i.e. supplier, ally and subsidiary firms).

4 Data analysis and results

The presentation of the data analysis and results develops around the two key themes which make reference to the two research questions: the former concerns the type of relationship between an automaker and its R&D partners and its influence on the co-patenting strategy, while the latter regards the value of patented inventions co-owned by the automaker and its R&D partners. Next paragraphs deal with them separately. In the presentation of the results, for the first issue we make use of a combination of illustrative examples and tables describing the data from which inferences were drawn (Miles and

⁶ *The 3 digit IPC codes which are considered core technology fields are those singularly associated to at least the 10% of the portfolio of single-owned inventions. In aggregate they represent from 75 to 83% of the total invention portfolio. They are listed in Table 7 in the appendix.*

Huberman, 1994); instead, for the second we base our considerations on the statistical analysis.

4.1 Co-patenting strategies between an automaker and its R&D partners

In order to understand the different patterns of co-patenting among the four considered automakers, we compared data regarding the selected automakers both at a firm- and patent-level. The differences in size of the four selected automakers are mirrored by their invention portfolios. Indeed, TTA counts a number of inventions which is four times the number of inventions of BMW. Similarly, the four automakers present differences in terms of number of co-assignees involved in the patenting activities and in the share of co-assigned inventions on the total portfolio, which point in the direction of different levels of innovation openness. Table 3 shows that TTA has a number of co-assignees definitely higher than other automakers, indicating a higher likelihood of co-patenting with many different partners. However, the average number of inventions per co-assignee is in line with FRD which has the lowest number of different co-assignees. This suggests that TTA does not concentrate many co-owned patented inventions with the same co-assignee, which is supported by the value of the Herfindahl–Hirschman Index (HHI) of patents describing the concentration of co-owned patented inventions with single co-assignees. The indicator CR4, a more direct measure of concentration, shows the share of co-assigned inventions owned by the first four co-assignees in terms of co-owned inventions, on total co-assigned patented inventions: the first four co-assignees of BMW own the 73% of all the co-owned patented inventions in BMW's portfolio, while in the case of TTA, the top four own the 36% of co-assigned inventions; FRD and VLW report lower values, between 51 and 59%.

Table 3 Descriptive statistics on co-assignments and concentration of co-patenting activities

Automakers	Number of different co-assignees	Average number of inventions per coassignee	Concentration of co-patenting activities	
			[HHI]	[CR4]
BMW	91	2.59	0.17	73%
FRD	25	3.64	0.16	59%
TTA	243	3.94	0.04	36%
VLW	46	2.70	0.13	51%

Figure 1 shows the distribution of the patented invention assignments in each automaker's portfolio distinguishing by the single-owned and the co-assigned inventions; co-assigned inventions can be, in turn, divided into those co-assigned with a company identified as one among the relationship types of supplier, allied or subsidiary and those co-assigned with other partners with no identified relationships, including non-formalized R&D partnerships.

Figure 1 Share of inventions owned by each automaker alone, co-assigned with a partner identified through one of the relationship types (supplier, ally, subsidiary) or with non-formalized relationship

The data suggest a certain heterogeneity across the examined automakers. The propensity to co-patenting is high both in terms of diverse involved partners and of share of co-assigned patented inventions on total portfolio for BMW and TTA, but the former seems to focus on a small group of partners, which absorb the largest part of the co-

assigned inventions, and still reports a long tail of occasional collaborations. On the contrary the figures for TTA show that co-assignments are relatively less concentrated and involve a higher number of partners. Values of propensity to co-patenting for VLW are similar to BMW and TTA at the invention-level, but the number of partners is much lower; however the concentration indexes suggest a middle position for VLW between the situation of BMW and the one of TTA. Quite different is the case of FRD: it shows a low propensity to co-patenting both in terms of number of partners and of share of co-assigned inventions and middle concentration levels.

Table 4 reports the main statistics on the co-patenting activities of the selected automakers by distinguishing on firm- and invention-level analyses, respectively in terms of percentage on total co-assignees and on total co-assigned inventions. In order to understand the shown values, it is necessary to note that not only a company might be considered a supplier, an allied and a subsidiary at the same time in CIQ, but also an invention might be co-owned by several firms in any of the three identified types. As a consequence, we took into consideration also the overlapping among categories (i.e., allies, subsidiaries and suppliers): the sum of the items 2.a 2.b and 2.c might exceed the corresponding aggregate value in item 2.

Focusing on the firm-level analysis related to the percentage of allies, subsidiaries and suppliers as co-owners on total co-assignees in Table 4, we can appreciate that, despite a common tendency towards co-patenting with suppliers, automakers follow different patterns in co-patenting with other R&D partners. Particularly, BMW registers the highest values for allies as co-assignees, whilst the lowest for subsidiaries. In contrast, FRD shows an opposite approach, favouring suppliers as R&D partners with whom to co-own patents rather than allies.

Table 4 Co-patenting by type of relationship (non-formalized, formalized and details on supplier, allied and subsidiaries co-assignees)

<i>Automakers</i>	<i>Relationship type</i>	<i>% on total co-assignees</i>	<i>% on total co-assigned inventions</i>
BMW	1.Non-formalized	70,4%	31,4%
	2.Any formalized relationship	29,6%	68,6%
	2.a Allied	15,4%	59,3%
	2.b Subsidiaries	1,1%	0,4%
	2.c Suppliers	19,8%	14,8%
FRD	1.Non-formalized	64,0%	38,5%
	2.Any formalized relationship	36,0%	61,5%
	2.a Allied	4,0%	36,3%
	2.b Subsidiaries	12,0%	9,9%
	2.c Suppliers	20,0%	15,4%
TTA	1.Non-formalized	81,9%	40,1%
	2.Any formalized relationship	18,1%	59,9%
	2.a Allied	6,2%	35,1%
	2.b Subsidiaries	4,5%	25,7%
	2.c Suppliers	12,3%	42,8%
VLW	1.Non-formalized	65,2%	31,5%
	2.Any formalized relationship	32,6%	67,7%
	2.a Allied	8,7%	8,1%
	2.b Subsidiaries	10,9%	45,2%
	2.c Suppliers	26,1%	66,9%

The invention-level analysis, that is the percentage on total co-assigned inventions in Table 4, shows different dynamics. For BMW and FRD, the share of patents co-owned with subsidiaries is very limited, preferring allies rather than suppliers. On the contrary, VLW co-own patents firstly with suppliers and then with subsidiaries, while co-assigned inventions with allies are not a relevant part of co-assignees inventions. Similarly, TTA privilege co-assignments with suppliers, but then the share of co-assignments with allies exceeds those with subsidiaries.

Comparing the shares of co-patenting on firm- and invention-level, the first general evidence is that on average only about one third of the automakers' co-assignees are among those with a formalized relationship, but they are responsible for around two thirds of the total co-assigned inventions. The data suggest that the latter represent occasional

collaborations, supporting the fitness of the identified relationships as representative of the co-patenting activities.

Concerning the analysis of the formalized relationship types, the four automakers seem to follow different strategies. The pattern for BMW shows that the co-assignees are mainly allied and suppliers but most of the co-assigned patented inventions are with the former; subsidiaries are not involved in the co-patenting activities of BMW. The case of FRD, characterized by a relatively small pool of co-assignees, is similar to the previous but the role of allied firms is more relevant because one of them is responsible for almost one third of the co-patenting activity. The figures of TTA reflect the tight relations with the Japanese company's suppliers, which are often also subsidiary or partners in formalized alliances, and the propensity to invest in co-patenting activities also through non-formalized relationships; hence, on the one side the share of inventions co-assigned with non-formalized partners is the highest (40%) among the four automakers and on the other side all the co-assignees with any relationship type have a significant share of joint inventions (in particular a small number of allies is responsible for circa one third of the co-patenting activities and around 43% of the inventions are co-assigned with suppliers which is the most frequent type of relationship). VW seems to differ from all the previous cases by involving allied companies in a more limited way: moreover, the only allies which co-own patents with VW are also suppliers and/or subsidiaries; the largest share (42%) of co-inventions is with two companies that are both suppliers and subsidiaries.

4.2 *The characteristics and value of patents co-owned by an automaker and its R&D partners*

The first step of the following analyses aims to understand the presence of differences in the R&D collaboration output with respect to single-owned inventions. We applied a probit model on the patented invention portfolios of the selected automakers having the co-assignment event as the dependent dummy variable, a set of patent bibliometrics as the independent ones and controlling for automakers and years dummies. Table 5 shows the ex-ante variables characterizing the filed inventions; on average, the co-assigned inventions are associated to a higher number of backward citations (BWDCIT), of inventors (INVENTORS) and of IPC subclasses, proxy of the technological scope (TECHSCOPE); co-owned inventions are also associated more often to IPC classes out of the company core technologies (CORETECH) than single-owned ones.

Table 5 Probit model on co-assignment event with robust standard errors (***) $p < 0.01$, ** $p < 0.05$, * $p < 0.10$)

VARIABLES	(1) model	(2) model	(3) Model
BWDCIT	0.087*** (0.020)	0.049** (0.022)	0.076*** (0.023)
INVENTORS	0.893*** (0.029)	0.913*** (0.030)	0.923*** (0.031)
TECHSCOPE	0.134*** (0.037)	0.108*** (0.037)	0.080** (0.037)
CORETECH	-0.290*** (0.041)	-0.301*** (0.041)	-0.293*** (0.042)
Year dummies		Yes	Yes
Automakers dummies			Yes
Constant	-1.780*** (0.051)	-2.053*** (0.339)	-2.212*** (0.348)
Observations	8,041	8,041	8,041
PseudoR2	0.152	0.169	0.176
Loglikelihood	-3161.827	-3100.003	-3072.973
Chi2	1021.653	1082.012	1059.542

The second econometric model investigates the role of the different types of relationship on the patented invention technological value, proxied by the forward citations (FWDCIT). The treatment effect model is computed on the subset of inventions until 2009 in order to limit the censorship effect connected to the forward citations variable for a total of 6,229 observations. Table 6 shows the coefficients and the standard errors of the equation for treatment effects in column (2), where the dummy for being a co-assigned invention is the dependent variable, and the general model in column (1) where the regression on the dependent variable “FWDCIT” takes into account the “treatment”, i.e. the co-assignment⁷.

The results in column (2) are consistent with the previous probit model on the full sample with no time limits, as expected. Focussing on the main equation in column (1) and on the relationship types dummies, the presence of a subsidiary or supplier company as assignee is significantly and positively associated to the number of received citations, while the presence of an allied firm among the co-assignees has no significant (but negative) coefficient. Also the presence of a co-assignee with non-formalized partnership is positively related to the proxy of technological relevance. The other variables

⁷ Equation (1) does not include the variables “CORETECH” and the “Automakers dummies” because, *ex ante*, there is no reason to expect that the technological importance of an invention should be related to one owner rather than another and to the centrality of a company technology portfolio.

describing the patented invention characteristics through bibliometrics (i.e., BWDCIT, INVENTORS and TECHSCOPE) have significant positive coefficients.

Table 6 Treatment effect model on weighted forward citations. Equation for treatment effects in column (2) with “Co-assigned invention” dummy as treatment; sample of inventions limited from 2004 to 2009; standard robust errors in brackets

VARIABLES	(1) FWDCIT	(2) Co-assigned invention

5 Discussion and conclusions

Relying on both descriptive and econometric analysis, this paper explores the patterns of co-patenting between an automaker and its allies, subsidiaries and suppliers, trying to unveil different strategies among the selected companies and to understand whether patented inventions co-owned with R&D partners having different relationships with the focal firm may be more or less valuable. Our findings provide a better understanding of the strategic decisions concerning IP ownership in open innovation activities such as collaborative R&D in the automotive industry.

First, we show that there seem to be different co-patenting strategies connected to the company propensity to resort to co-assignments as output of R&D collaborations and in terms of preferences on one relationship type (subsidiaries, allies or suppliers). According to the analyses, we define four main strategies, named *contingent*, *purposive*, *watchful*, *advanced*, which are also represented in *Figure 2*, where the arrow traces a possible evolution regarding the co-patenting strategy.

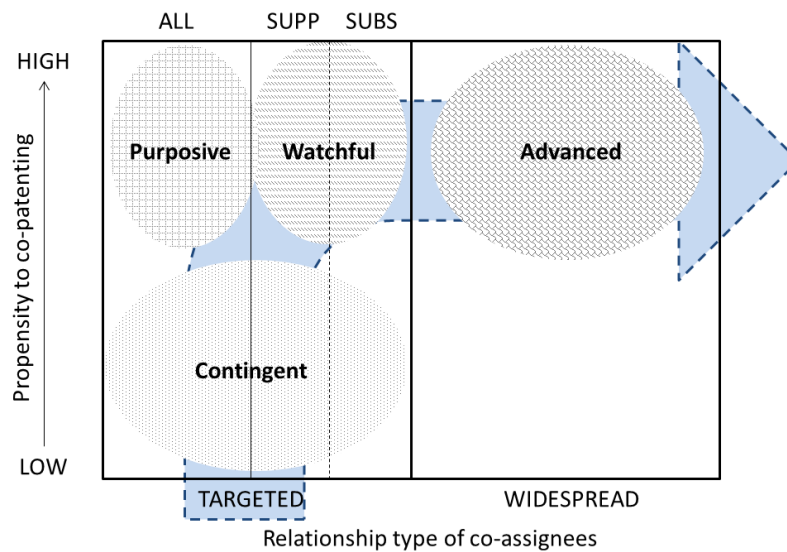

Figure 2 Scheme of categories for co-patenting strategies according to the most frequent relationship types with the co-assignees

Contingent strategy is associated to automakers with relatively low co-patenting propensity and with a preference for one relationship type which absorb the largest part of the co-assigned inventions. It is case of the establishment of a specific R&D collaboration in response to an emerging need which the company might find particularly difficult to satisfy with its internal competences: the R&D collaboration output concentrated on a very small number of partners might be considered as an exception to the usual occasional approach. Among the cases we analysed, FRD seems to adopt a contingent strategy. The American automaker shows the lowest propensity to co-patenting among the examined automakers, which may be determined to the specific regime governing co-patenting in the US where the co-assigned patent can be used or licensed by both assignees without approval from the other. The largest part of FRD's co-patented

inventions are jointly assignments with the allied company Daimler AG, regarding the R&D collaboration on the fuel cell technology which was also supported by the creation of the joint venture “Automotive Fuel Cell Cooperation”.

Purposive and *watchful* strategies identify automakers with a relatively high propensity to co-patenting. They are characterized by non-negligible amounts of co-assigned inventions with all the three types of partners but some of them clearly absorb the largest share of the co-patenting activities. We distinguish between the focus on allied co-assignees for the *purposive* approach and on subsidiaries and suppliers for the *watchful* one. We argue that the relationships with the two latter groups should suffer less from the risks of unintended knowledge leakage or undesired licensing agreements since, in addition to the intellectual property rights of the co-owned invention, the focal firm may exerts its controlling role and the threat of changes in the supply contract, nonetheless operating in a more familiar environment. Similar to the *contingent* strategy, the *purposive* one shows a preference for co-patenting with a relatively small group of allies. Overall the normal R&D collaboration rates inherent the supplier and subsidiary firms, the focal firm share the patent ownership of a high number of inventions with few allied partners on specific cutting-edge research projects. This is the pattern of BMW which, among the other R&D collaborations, was particularly involved in the development of a number of inventions with General Motors, Chrysler and Daimler on a set of hybrid vehicle technologies in the so called “Global Hybrid Cooperation” from 2005 (Dawid *et al.*, 2013). The *watchful* strategy of automakers with a relatively high propensity to co-patenting activities is focused on co-assignments with suppliers and subsidiaries, suggesting a more cautious approach in the choice of partnerships when disclosing competences and in the appropriation regimes when developing new technologies. The data analysis exhibits that, despite being the automaker with the smallest patent portfolio, VW shows a high co-patenting level; the two largest co-assignees of VW are Audi AG and Hella KG Hueck, respectively key subsidiary and supplier, assuring to maintain in-house technological and engineering capabilities.

The *advanced* strategy is associated to automakers with a significant propensity to co-patenting, that is to open innovation practices. The category is characterized by a large number of co-assignees distributed across all the relationship types. TTA seem to be the automakers having the most mature co-patenting strategy: it exceeds the other firms with respect not only to the share of co-patenting in their portfolio, but also in the variety of

R&D partners it co-owns patented inventions with. Anyway, suppliers play the predominant role in line with the general approach of TTA towards them, that is closely involved in the innovation process (Harhoff *et al.* 2012) and with the characteristics typical of the Japanese *keiretsu* group structure. The environment in which TTA operates and collaborates is protected also by a particular overlapping of relationship types with the co-assignees, suggesting that TTA is attentive to safeguard itself with additional clauses. By way of example, the largest R&D partners of TTA in terms of co-assigned inventions are Denso Corp. Aisin and Toyota Industries Corp which are direct suppliers and companies with direct or indirect ownership ties with the Toyota Group.

The differences across the relationship types emerge when performing analyses on the invention level. We first carried out a probit model to estimate the differences between the single-owned and co-assigned inventions. As expected the number of inventors is significantly larger (the simple mean values are 4.4 and 2.5 respectively for co-assigned and single-owned inventions) which is likely to be associated to the involvement of one team of researchers from each of the involved co-assignee. Also the other proxies of complexity, the number of backward citations and the technological scope, although with a small average marginal effect (around 2% each), are higher for the co-assigned inventions. Moreover the co-assigned inventions are more often in technological fields which are not the common ones covered by the focal firm. From the evidence, we argue that the automakers generally co-develop inventions which are more complex and in technological domains where the focal firm has less expertise.

The results from the second econometric model suggest that the technological relevance is not the same across the co-assigned inventions when distinguishing by the type of relationship with the R&D partner: the results point to a higher value of patented inventions for subsidiaries and suppliers while a collaboration with allies is not associated to an improvement in the average technological relevance. This evidence indicates that firms are more able to generate valuable innovations collaborating with partners with a tighter relationship correspondent either to the direct ownership or the existence of a solid supply contract, that is driven by the lower *a priori* risk of disclosing technologies and revealing competences. The examined firms might have found difficulties in the R&D collaboration process with allied partners, ending up with a lower-than-average invention. An additional explanation might concern the fact that the co-owned patent may represent an important landmark in the R&D alliance (Hagedoorn *et al.*, 2003) and signifies its

successful completion or even a specific contract milestone included to ease the technology management as a whole. In other circumstances, sole ownership of the co-developed knowledge might not be feasible since the partner may well be unwilling to relinquish control, forcing partners to co-own the technology; hence, collaboration and IP sharing may be the only route to successful invention (Belderbos et al., 2013). In these situations, the companies might file patent applications with no interest in their actual value.

These findings confirm that the choice of the governance mechanisms appears to be key in order for automakers to access external specialized knowledge while avoiding issues of partner's opportunism, knowledge leakage, and appropriability (Trombini and Zirpoli, 2013).

5.1 Theoretical and managerial implications

The present study reveals useful insights both for the academic community and managers. As far as the theoretical implications are concerned, our study has made several contributions to the study of R&D collaborations and co-patenting literatures. First, it presents an alternative approach for investigating co-patenting with partners having different types of relationships, providing a more fine-grained distinction among different types of partner. Compared with some similar studies (e.g., Belderbos *et al.*, 2013) which mainly analyse the cooperation with suppliers, customers and competitors and universities, our findings examine the co-patenting strategies between automakers and its allies, subsidiaries and suppliers, since the initial contractual design of technology partnerships can have important value-creation implications (e.g., Sampson, 2004; Faems *et al.*, 2005). Second, the study explores the value of co-owned patented inventions depending on the type of relationships the focal firm has with its R&D partners, thus responding to an explicit call for research investigating if, and to which extent, R&D policies such as direct subsidies for R&D collaboration, for instance, play a role in driving either kind of collaborative activity as well as the effects on patenting both in terms of quality and quantity (Hottenrott and Lopes-Bento, 2012). Third, the combination of two different databases which allow to integrate patent data with information about the governance mechanism is particularly valuable from a methodological point of view, as well as the use of inventions instead of patents. Last, since the propensity to co-patenting provides an indication of the propensity to R&D collaboration and, thus, to open

innovation, this paper contributed to the enlargement of the literature regarding open innovation which continues to be innovation has become one of the hottest topics in innovation management (Huizingh, 2011).

In addition, our findings provide some important implications for managers concerned with IP ownership. In particular, it offers useful insights concerning the different strategies a firm may pursue in order to share IP with its R&D partners, as well as a possible trajectory in order to improve their co-patenting strategy. In addition, we argue that the preference towards subsidiaries and suppliers rather than allies might be connected to firm risk aversion, as the econometric invention-level analyses demonstrate. Hence, managers need to take into account that *ex-ante* negotiations on co-patenting arrangements may have a beneficial impact on the value-creation dynamics in collaborative R&D, overall with allies. Moreover, results related to the technological relevance of co-owned patented inventions suggest that focal firms co-develop inventions which are more complex and in technological domains where the focal firm has less expertise, which could be used commercially in order to enhance their reputation.

5.2 *Limitations and opportunities for future research*

We acknowledge that our study has several limitations. One of which is that the empirical results are derived from four automakers which have been considered as exemplars of different strategies concerning the appropriation of the results of co-innovation. Future studies could investigate this issue for more cases in the automotive sector, as well as in different industries, in order to extend the generalization of the findings and test the taxonomy proposed for co-patenting strategies. Moreover, this is an exploratory study based only on secondary data. For this reason, primary data collected directly from companies, but always related to co-patents as the output of collaboration with external partners for innovation, could reveal significant supporting insights. Further, we did not discriminate among the different alliance forms, which could represent another possible extension of our study. In addition, some more interesting issues such as the consequences, for example from a financial and economic perspective, of the adoption of different co-patenting strategies could be explored in future research.

Structured Abstract

Purpose – The present contribution addresses the implementation of an Integrated Management Control System which aims to combine the company's intangible resources, known in literature as Intellectual Capital (IC), with long-term sustainability factors. The study concerns a company operating within the Aerospace and Defence field which has developed an Intellectual Capital report in order to manage sustainability projects and meet the stringent criteria required for inclusion in the Dow Jones Sustainability Index (DJSI).

Design/methodology/approach – The qualitative research approach underlying the investigation is Interpretivism; more specifically, the study was conducted in the light of "action research" (Dumay, 2010). Data were gathered from in-depth interviews with managers as well as from group discussions. A framework aiming at fostering a sustainable management strategy was elaborated and successfully applied to a series of specific corporate initiatives..

Originality/value – The paper contributes to the extant literature by questioning whether it is possible to link IC and sustainability initiatives in order to have a positive impact on the assessment process companies are subject to for inclusion in the DJSI. As per today, in fact, no research paper has addressed this topic.

Practical implications – The outcomes of the research suggest that the adoption of an integrated management control system, providing a link between intangible assets and capabilities that create value within a sustainability framework, not only provides an effective support to general management but it could be reasonably assumed to have a positive impact on the assessment process companies are subject to for inclusion in the Index.

Keywords – Intellectual Capital, Corporate Sustainability, Dow Jones Sustainability Index, Integrated Management Control System.

Paper type – Academic Research Paper

1. Introduction

Over recent years, the phenomenon of Socially Responsible Investment has grown significantly: in response to the recent corporate scandals that have marred the international financial scenario, there has been an increased pressure on enterprises to integrate the three pillars of sustainability into general business management. According to *Artiach et al.* (2010), corporate sustainability performance “measures the extent to which a firm embraces economic, environmental, social, and governance factors into its operations, and ultimately the impact they exert on the firm and society”.

As a consequence, a considerable number of companies has strengthened its commitment to corporate sustainability by providing external stakeholders - such as providers of funds, customers, suppliers, employees, local communities and government - with supplementary non-financial statements, along with traditional accounting ones. The main aim of such a voluntary disclosure is to shed light on the firm’s value creation and distribution processes; additionally, these reports can be regarded as a means of communication to those investors who determine their portfolios’ asset allocation on the basis of a company’s commitment to the concept of sustainability.

In response to the emerging collective interest in Socially Responsible Investment (SRI), also termed *ethical or sustainable* investment, and with the aim of providing investors with further insight into corporate sustainability performance, organizations of recognized prestige have developed indexes linked to financial markets (*López et al.*, 2007; *Searcy & Elkhawas*, 2012). Among these, of particular prominence are the Dow Jones Sustainability Indexes (DJSI) and the FTSE4Good Index (*Knoepfel*, 2001; *Cerin & Dobers*, 2001; *Chatterji & Levine*, 2006).

In our paper the attention is focused on an Italian entity operating within the Aerospace and Defence field; the holding company of the high-tech Group, listed in the FTSE MIB and the NYSE, has been recently included in the Dow Jones Sustainability Index (DJSI). As a consequence, the management of the analyzed entity has decided to issue a master plan to implement specific sustainability initiatives meanwhile looking for a financial rationale to justify its decision making.

With the purpose of broadening the functionality of existing models, we suggest an integrated management control system which, providing a link between intangible assets and capabilities that create value for a sustainable development, can be regarded as an effective support to corporate management.

In particular, it could be reasonably assumed that the adoption of an integrated management control system may positively impact the assessment process companies are subject to for inclusion in sustainability indexes.

From a methodological point of view, the investigation is the result of an on-going research project carried out together with the management of the analyzed company, that is, it takes an “action research” perspective. The observations and conclusions reached here are limited to this case study and based on the Authors’ interpretations of facts; therefore care should be taken in generalizing any of the outlined findings.

The paper is structured as follows. In Section 2, brief review of the relevant literature on sustainability indexes and management control systems is presented. The research methodology is described in Section 3, whereas Section 4 summarizes the findings of the analysis. Conclusions follow in Section 5.

2. Literature Review

Socially Responsible Investment and Sustainability Indexes

Over recent years, commitment to corporate sustainability - by definition “a business approach that creates long-term shareholder value by embracing opportunities and managing risks deriving from economic, environmental and social developments” (RobecoSAM, 2013) - has been gaining increased prominence worldwide. In the wake of the international financial meltdown, the general awareness of corporate misconduct has indeed undeniably amplified the pressure on enterprises to demonstrate their performance in terms of contributions towards the social and environmental dimensions.

The growing awareness that ‘ethical’ investments might produce better financial performance, has prompted numerous companies to publish on a voluntary basis *ad hoc* reports, commonly referred to as sustainability reports, with the aim of guiding investment decisions (Berthelot *et al.*, 2012). Within this context, the Global Reporting Initiative (GRI), has issued a set of guidelines which provide the most recognised global framework for sustainability reporting. Nonetheless, most of the indicators displayed in sustainability reports is qualitative in nature and, therefore, do not lend themselves well to financial valuation (Lackmann *et al.*, 2012).

With the aim of providing guidance for investors seeking further insight into sustainability performance, an array of sustainability indexes has been designed to measure the performance of those firms that set industry-wide best practices with regard

to sustainability. For companies, inclusion in Socially Responsible Investment indexes can be regarded as a means to enhance corporate reputation by signalling responsible behavior: it has indeed been argued that sustainability indexes serve as informational intermediaries between companies and their stakeholders (such as analysts, brokers, and financial institutions) by evaluating the disclosed sustainability related information (*Robinson et al.*, 2011). From the investor's point of view, such indexes provide an independent and reliable tool which allows investors to identify the world's sustainability leaders for different industries and to perform regional and global benchmarking (*KPMG*, 2013).

On the academic side, the extant literature on sustainability indexes has tried to point out whether inclusion in, or deletion from, such indexes has a significant impact on the value of listed companies (*López et al.*, 2007; *Curran & Moran*, 2007; *Consolandi et al.*, 2009; *Doh et al.*, 2010; *Cheung*, 2011; *Robinson et al.*, 2011; *Becchetti et al.*, 2012; *Clacher & Hagenrdoff*, 2012; *Lackmann et al.*, 2012), the relative strengths and weaknesses of these indices (*Chatterji & Levine*, 2006) as well as benefits and challenges of sustainability ratings (*Delmas & Blas*, 2010; *Sadowski et al.*, 2010; *Windolph*, 2011). However, as pointed out by *Fowler and Hope* (2007) and more recently by *Searcy* (2012), little is currently known about how sustainability indices are used in practice by corporations and what steps corporations have taken to be or remain included in the DJSI.

Within the realm of sustainability indexes, the most widely recognized are the Dow Jones Sustainability Indexes (DJSI) and the FTSE4 Good. Since the examined research project involves a company which has been recently listed in the DJSI, in the following a brief overview of the aforementioned is provided.

Dow Jones Sustainability Indexes

Established in 1999, the Dow Jones Sustainability Indexes (DJSI) track the performance of the world's largest companies leading the field in terms of corporate sustainability, i.e. "a company's capacity to prosper in a hypercompetitive and changing global business environment" (*RobecoSAM*, 2013). The DJSI family, maintained collaboratively by S&P Dow Jones Indices and RobecoSAM, includes global and regional broad market indices, sub-indices excluding alcohol, gambling, tobacco, armaments and firearms and/or adult entertainment, and global and regional blue-chip indices.

Since its inception, Robeco SAM has been conducting the annual Corporate Sustainability Assessment (CSA): over 2.500 of the largest companies in terms of float-adjusted market capitalization from all industries within the Dow Jones Global Total Stock Market Index are invited to participate in RobecoSAM's CSA. The assessment, based on information provided by the companies through the online questionnaire, is built on a range of financially relevant sustainability criteria covering the economic, environmental and social dimensions. Each single dimension is initially given equal weighting (33%) and includes a defined set of general criteria (Table 1); industry-specific criteria are also evaluated. Each indicator receives a score of between 0-100 points, which is then multiplied by the weight of the industry-specific relevant criteria.

Economic Dimension	Environmental Dimension	Social Dimension
<ul style="list-style-type: none"> • Corporate Governance <ul style="list-style-type: none"> • Codes of Conduct, Compliance, Corruption & Bribery • Risk & Crisis Management • Customer Relationship Management • Investors Relations Management 	<ul style="list-style-type: none"> • Environmental Management System • Environmental Performance <ul style="list-style-type: none"> • Climate Strategy • Product Stewardship • Biodiversity 	<ul style="list-style-type: none"> • Human Capital Development • Talent Attraction and Retention • Occupational Health and Safety • Stakeholder Engagement • Social Reporting

Along with the Corporate Sustainability Assessment and in conjunction with RepRisk - the leading provider of information on compliance by companies with the principles of the UN Global Compact - a Media and Stakeholder Analysis (MSA) is carried out. The purpose of the MSA is “monitoring media and stakeholder commentaries and other publicly available information from consumer organizations, NGOs, governments or international organizations to identify companies' involvement and response to environmental, economic and social crisis situations that may have a damaging effect on their reputation and core business” (RobecoSAM's Corporate Sustainability Assessment Methodology, 2013 p. 10).

Should a company incur a reputational risk - such as economic crime or corruption, fraud, illegal commercial practices, human rights issues, labor disputes, workplace safety, catastrophic accidents or environmental disasters – the information publicly available is taken into account in calculating the total score of MSA.

In the light of what has been said above, there is no doubt that a sustainability-oriented management control system, could significantly have a positive impact on the assessment process companies are subject to for inclusion in the DJSI.

Consequently, we suggest that:

Proposition 1

A sustainability-oriented management control system, could significantly have a positive impact on the assessment process companies are subject to for inclusion in the DJSI.

3. Research Methodology

The theoretical paradigm underlying our research is the interpretivist model. In light of interpretivism, sociological phenomena cannot simply be observed but must also be interpreted by the researcher. This means that there is not one absolute reality, but rather different possibilities are generated by the perspective adopted to interpret the facts (ontological dimension). Moreover, there is no separation between researcher and subject since the process of understanding derives from deductive-inductive development (epistemological dimension) (Ryan *et al.*, 2002, p.34).

The selection of a company belonging to the aerospace and defence sector is consistent with our research aims because in this sector there are large global competitors, whose products and services incorporate a high value of high technology that spreads not only from the financial capital of the firms but also from its human, structural and relation-based capital spheres.

In particular we decided to focus on the case of a large company leader in systems integrators whose headquarters are located in Italy. The selection of this entity is consistent with our research addressing the management choice of a specific IC approach among the several existing in literature. In recent years the company's CEO has demonstrated his interest in increasing the company's IC through the realisation of an organisational unit entirely devoted to promoting product innovation, increasing patents and trademarks, strengthening personnel competences and enabling communities and academic relationships.

Finally, the company CEO is concerned with adopting an IC measurement approach. This allowed us to be involved in a company project aiming to identify, measure and

manage intangibles resources. Our analysis offers also a picture of how managers can intervene in processes of knowledge development, sharing and application within the firm.

Accordingly it is extremely important to define our role, as researchers inside the company, which was not of researchers just observing phenomena, nor consultants but rather driven by “action research” principles.

3.1 Action research

Action research attempts to combine the process of research and action based on what *Shein* (1987) describes as a key assumption – that one can never really understand any human system without trying to change it. Thus, a key aim of action research is to increase both researchers’ and practitioners’ understanding. *Reason & Bradbury* (2006, p. 1) define action research as a process that “...seeks to bring together action and reflection, theory and practice, in participation with others, in the pursuit of practical solutions to issues of pressing concern to people”.

The researcher is seen to act on that situation in concert with the host organisation, observes process and outcome, and analyses findings in view of the relevant literature. This methodology not only reflects upon the observations of the researcher, but also on the impact the interventions have in the organisation. The main benefit for researchers is the ability to develop insights into the implementation of new management innovations in organisations; for practitioners the benefit is to gain the assistance and knowledge of academics as a resource in the implementation process (*Dumay*, 2010).

There is not an agreed set of methodological protocols, or rules, shared by all researchers; however action research usually begins with the establishment of initial contact between the action researcher and representatives of the organisation. This early stage of research, often called the entry stage, entails identification of perceived ongoing problems within the organisation, who “the client/stakeholder” is, and who will participate in the research, how, where and when.

During the entry stages of the action research process, either the organisation or the researcher can take the initiative in presenting the problem. The action research mode involves a close collaborative relationship, where there is a mutual agreement at each stage of the action research sequence in order to contribute both to the practical concerns of people and to the goal of social science. Diagnosis is a pivotal stage in action research

because the researcher may introduce a conceptual scheme and theories to organisational members that enable them to reinterpret how they understand their situation. The aim is to develop an organisation's members understandings and to co-determine and plan possible interventions.

4. Analysis and Findings

4.1 Context: the aerospace and defence sector and company management

Players in the aerospace and defence sector are generally large, integrated multinational companies that are highly diversified in terms of both the products they manufacture and their geographical presence. This scale makes it difficult for new companies to enter the market, a problem further exacerbated by the high capital outlay and expertise needed for market success to be achieved. Rivalry in this market is strong. Expertise and knowledge is crucial to the success of companies, as the work is highly specialised. Companies in the industry are obliged to adhere to strict regulations involving national security, export restrictions and licensing for military goods, accounting rules and safety requirements.

The analysed company, entirely owned by an Italian listed multinational company, designs and develops Large Systems for Homeland Protection, systems and radars for air defence, battlefield management, naval defence, air and airport traffic management, coastal and maritime surveillance. Considering the strategic sector in which the company operates, detailed information about the company is not included and not relevant in order to discuss our findings.

4.2 The entry stage

Alvesson and Deetz (2000, p. 17), said that the task of "insight" is to demonstrate "our commitment to the hermeneutic, interpretive and ethnographic goals of local understandings closely connected to an appreciative of the lives of real people in real situations". So, insight from a critical interventionist perspective involves trying to understand the impact of practice on both people and the organisations to which they belong.

The early stage of research, often called the entry stage, entails identification of: perceived ongoing problems within the organisation, who "the manager/stakeholder" is, who will participate in the research, and how, where and when.

Thus, the first issue is the identification of the main users of IC information. In the case study analysed the primary IC information user identified is the company's top management. While disclosure of IC information to external stakeholders is a further important aim, it is not included here because the entry stage was focused on managerial decision making.

The joint research group was composed of two managerinvolved in the project and two academics. In the entry stage the main role of the researchers was to introduce the IC conceptual scheme and theories to organisational members enabling them to reinterpret how they understand their company, while the main role of the practitioners was to assess their usefulness in practice.

Supervisors of the research group outcomes were a senior professor and the company CFO, while the main goal was to present for validation to the company's CEO a model to evaluate the measurement and management of the intangible assets of the company, which can be integrated in managerial practices supporting company decisions.

During the entry stage of the action research process, either the manager or the researcher can take the initiative in presenting the problem. In a consulting environment, the client most usually presents the problem, and in "basic" research the researcher generally asks for access to research a problem in which he or she is interested. The essential difference between the action research mode and the others lies in the former's close collaborative relationship, where there is a mutual agreement at each stage of the action research sequence in order to contribute both to practical concerns and to the body of knowledge.

4.3 Diagnosis

Diagnosis forms a pivotal stage in action research; it implies an understanding of the organisational context, an analysis of the practical problems and challenges faced. Diagnosis entails also the production of ideas for how to change the organisation.

In this case, the "researcher and "practitioner" create a model to evaluate the measurement and management of the intangible assets of the company, which can be integrated in managerial practices supporting company decisions.

4.3.1 Visualizing the company's Intellectual Capital within a sustainability framework

All the information gathered about the sector and the company profile allowed us understand why it is of crucial importance for the company to focus its attention on intangible resources. In fact, due to the fast growing competition in innovation and new technologies, the company constantly needs to increase intangible stock, as well as the effectiveness and efficiency of its use.

The first step of the process consists of the mapping of the available intangible resources that must be reinforced or acquired in response to management's suggestions and that support the strategic objectives of the company (Demartini & Paoloni, 2013) (see Figure 1).

Figure 1: Case study - Visualizing IC

Next, coherently with the new sustainability thinking, the Top Management decided to integrate the aforementioned IC visualization of the company with sustainability categories (Figure 2). It has therefore been decided to integrate the proposed scheme with the main intangibles which are monitored and assessed by the Dow Jones Sustainability Index (RobecoSAM, 2013).

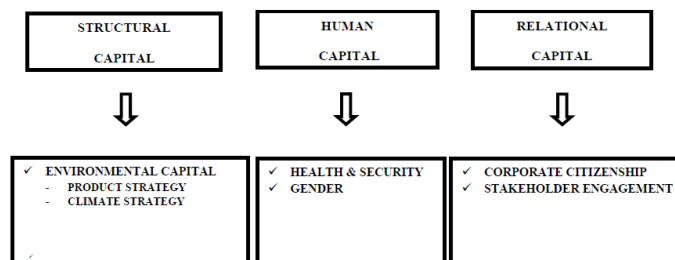

Figure 2 – Implementing Sustainability categories as per DJSI

Afterwards, each project launched by the company that has a relevant impact on IC undergoes calculation, evaluation and reporting. Even in this case, the traditional vision of IC is used in the three areas represented by Structural, Human and Relational capital.

On one hand, the application of the model represents a managerial innovation for the company's single unit whereas, on the other, it offers an powerful reporting tool for the whole firm.

4.3.2 How the process works in practice

The pilot project the research group was responsible for concerns the implementation of the outlined model to a series of specific initiatives that the company planned for 2013 in line with a sustainable management, namely: *Life Cycle Assessment (Eco Design)*, *Eco Recycling*, *Age Diversity Management*, *Green Communication*, *Green Procurement* and *Charity & Welfare*.

As this project is ongoing, the following analysis concerns only the IC Measurement activity. The Intellectual Capital Measurement model implies the identification and use of a tailor-made measurement system. In order to monitor each single initiative, a set of performance indicators is available:

- *effectiveness indicators* (to monitor if the organization has reached the planned goals);
- *efficiency indicators* (to monitor the related costs);
- *indicators to measure the impact the initiative has on the company's IC* and
- *indicators to measure financial performance*.

In the following, in order to show how the process works concretely, we will concentrate on the *Green Communication* and the *Green Procurement* initiatives.

Green Communication Initiative

The aim of the project is to set a plan for communication, both internal and external, in order to increase the awareness of the company's commitment to sustainability. To this end, the company has decided to realize a communication campaign addressed to external stakeholders (local authorities and communities, customers, etc...) in order to communicate the low impact of radar emissions on the population. Moreover, a digital "green platform" giving information on the web about the company's sustainable projects has been launched.

Indicators are defined by personnel in charge of specific initiatives with the support of experts on intangibles management control, whose task is to gather data for management reporting. Possible indicators - useful for the *Green Communication* initiative - are listed in Table 1.

Table 1 – Indicators for *Green Communication* initiative

EFFECTIVENESS AND EFFICIENCY INDICATORS		EFFECTS ON FINANCIAL PERFORMANCE (SHORT AND MEDIUM/LONG TERM)
<p><u>EFFECTIVENESS</u> Indicators with respect to the fixed goals</p> <p><u>EFFICIENCY</u> Incurred vs estimated costs</p>		<p><u>REVENUES INCREASE</u> Potential increase in revenues due to an increase of the "green" value perceived by customers, local governments and end users.</p>
IMPACT ON INTELLECTUAL CAPITAL		
STRUCTURAL CAPITAL	HUMAN CAPITAL	RELATIONAL CAPITAL
<p><u>INFRASTRUCTURES INNOVATION</u> Number of implemented portals</p> <p><u>ENVIRONMENTAL CAPITAL</u> PRODUCT STRATEGY: Reduction of paper use for promotional material / leaflets / brochure (€)</p>	<p><u>BEHAVIOURS</u> Degree of diffusion of "green" culture within the company (to be measured with a proxy, e.g. how many times the portal has been accessed)</p>	<p><u>STAKEHOLDER ENGAGEMENT</u> Effectiveness of the digital "green" platform (to be measured with a proxy, e.g. . how many times the portal has been accessed)</p>

Green Procurement Initiative

The aim of the project is the review of the process that leads to the inclusion in the register of suppliers, as well as the related evaluating/monitoring criteria and the associated documents (letter, questionnaire, evaluation form, etc.) in order to take into account the sustainability requirements expressed in the Dow Jones Sustainability Index questionnaire. To this end, the letter sent to the suppliers for inclusion in the register has been revised and then published on the company's intranet. Additionally, new requirements have been introduced both in the questionnaire and evaluation form.

Even in this case, indicators will be defined by personnel in charge of specific initiatives with the support of experts on intangibles management control, whose task is to

gather data for management reporting. A list of possible indicators - useful for the *Green Procurement* initiative – is shown in Table 2.

Table 2 – Indicators for *Green Procurement* initiative

EFFECTIVENESS AND EFFICIENCY INDICATORS		EFFECTS ON FINANCIAL PERFORMANCE (SHORT AND MEDIUM/LONG TERM)	
<p style="text-align: center;"><u>EFFECTIVENESS</u> Indicators with respect to the fixed goals</p> <p style="text-align: center;"><u>EFFICIENCY</u> Incurred vs estimated costs</p>		<p style="text-align: center;"><u>REVENUES INCREASE</u> Increased revenues (greater value in use for customers) in the medium/long term Capitalization of patents and environmental certifications (to be evaluated ad hoc)</p> <p style="text-align: center;"><u>COST REDUCTION</u> Reduction of volumes, packaging, transport and energy costs (€ or %) in the medium/long term</p>	
IMPACT ON INTELLECTUAL CAPITAL			
STRUCTURAL CAPITAL		HUMAN CAPITAL	RELATIONAL CAPITAL
<p style="text-align: center;"><u>PROCESS INNOVATION</u> Number of new processes integrated into the management system</p> <p style="text-align: center;"><u>INFRASTRUCTURES INNOVATION</u> Number of implemented portals Digital Supplier Register</p> <p style="text-align: center;"><u>ENVIRONMENTAL CAPITAL PRODUCT STRATEGY</u> Reduction of the volume of hazardous substances (€ or %); Reduction of volumes/reduction of packaging and transport costs (€ or %)</p> <p style="text-align: center;"><u>CLIMATE STRATEGY</u> Reduction of CO2 emissions (€ or %) Reduction in energy consumption (€ or %)</p>			<p style="text-align: center;"><u>SUPPLIER RELATIONSHIP</u> Number of suppliers that meet “green” requirements (% of green procurement)</p>

5. Discussion and conclusion

The opportunity to be involved in a research group allowed us to follow the process of choosing a useful IC approach/tool. As this project is ongoing, the following discussion analyses only the diagnostic stage; discussion on the implementation of the pilot project will follow next year.

The traditional tripartite IC model takes into account the human, structural and relational capital as assets of the company and, therefore, examines how they can be best developed according to the company's strategy. Sustainability responds to the expectations of the stakeholders by developing and maintaining a social justification for the company.

As argued by *Surroca et al.* (2010) and *Perrini et al.* (2012), we believe that intangibles are the mediating variables between sustainable management and corporate financial performances. This kind of projects, in fact, supports firms in the accumulation process of intangible resources, such as skills, competencies, knowledge, innovation, values, legitimacy, trust and reputation. So far, it is clear that in a knowledge economy, Intellectual Capital is the driver for "creating and managing sustainable competitive advantage" (*Petty & Guthrie*, 2000, p.155) and for value creation in the medium-long run (*Lev* 2001).

In regard to Proposition 1 - *a sustainability-oriented management control system, could significantly have a positive impact on the assessment process companies are subject to for inclusion in the DJSI*, we believe that the application of the outlined model represented an organizational innovation that significantly contributed to the company's managerial system, helping to maintain inclusion in the DJSI.

Consistent with *Orth and Kohl* (2012), we deem that more focus should be placed on the concept of how integrated thinking is embedded within an organization, rather than concentrating only on the content and features of the company's voluntary disclosure such as Intellectual Capital Statement, Sustainability reporting or an Integrated document.

In our case study, Top Management awareness of the usefulness of integrating IC and corporate social responsibility perspectives into the company's management system and communication process arose following the inclusion of the company in the Dow Jones Sustainability Index.

Furthermore, our findings aim to demonstrate that measurement is not the main goal of managerial accounting, rather a means to manage and create value. As *Mouritsen &*

Larsen point out (2005), in fact, there is an additional *management control agenda* where information about IC is an input to management activities. This means, to be able to understand the relationships existing between measurement on one side and operational activities, strategies and context on the other. In such a way, we founded that is crucial for managers to be aware of the mechanism that allows a certain sustainability-driven initiative to increase specific intangibles (operational-side) and which intangibles need strengthening in order to increase the competitive advantage of a firm (strategy-side) within a particular context.

To date, the main critical factor arising from the diagnostic stage is the accurate identification of the projects and the actors involved in the new process for the identification, measurement and management of Intangible Capital.

The process mentioned above provides a comprehensive view of IC practices within the company; however, in order to make it work, the cooperation of all owners of the information is requested. Retrieving data involves identifying such individuals, which is not always easy in a big business reality; it also implies interfacing with the various parties to obtain all contributions. This is not straightforward since the model is still at an experimental stage and not yet widely accepted in the business management system. To overcome these obstacles that might impede the implementation of IC management procedures within the firm, we suggest pilot projects are a convenient starting point so that emerging problems and opportunities can be dealt with as they arise by personnel involved in day-to-day activities. The chance that a new reporting system is effective relies also on its “value in use” as perceived by the “owners” of the information.

Despite the critical aspects of the model, there are also many advantages. Thanks to the holistic view of the entire IC within the company, through an approach based on monitoring each single initiative, it was possible to implement actions to support the management of these projects, bridging the inefficiencies that would otherwise remain.

The observations and conclusions are limited to the analyzed case study and based on the Authors’ interpretations of the facts. Therefore, care should be taken in generalizing any of the outlined findings. Future research will continue to monitor the way in which the company manages, measures and reports on its Intellectual Capital. Longitudinal research should continue to provide insights into managing, measuring and reporting IC over time.

Structured Abstract

Purpose – The purpose of this paper is to understand the role of negative emotions in modern work life. The paper aims to identify antecedents and consequences of negative emotions especially in the context of knowledge work performance. The viewpoint is managerial and underlying assumption that negative emotions are not always bad.

Design/methodology/approach – This paper is based on a literature review. First, the nature and roles of negative emotions in organizational context are investigated by analysing models and theories explaining how emotions are linked to workplace events, behaviors and outcomes. Second, antecedents and consequences of negative emotions and affective states (e.g., angry, frustrated, worried, sad) are explored. The paper aims to construct a conceptual model for the basis of later empirical research.

Originality/value – This paper introduces a managerial approach to identify and manage the triggers and impacts of negative emotions in knowledge-intensive organizations. To complement the more conventional approach of preventing and eliminating negative factors, this paper focuses on the positive aspects of negative emotions.

Practical implications – The outcomes of the paper provide new understanding for managing negative emotions in companies in a way that they can be transformed into positive asset and business value. This paper identifies various events and behavioral links that could be intervened and influenced in order to attain positive performance outcomes.

Keywords – Negative emotions, knowledge work, performance

Paper type – Academic Research Paper

1 Introduction

Individual knowledge workers are central performance drivers of knowledge-intensive organizations (Amabile, 1998; Dove, 1998; Drucker, 1999; Käpylä et al., 2011). Therefore, management literature has increasingly focused on the peculiarities of knowledge work and continuously seeks new ways of organizing and managing these valuable assets. The literature on knowledge-intensive organizations (Alvesson, 1993; Starbuck, 1992, 1993; Blackler, 1995) recognizes several organizational characteristics that need to be considered when developing management systems. Literature on knowledge workers, on the other hand, has focused more on the actual work and highlights the importance of objectives, purpose of work and provides various means to improve knowledge work performance (e.g., Davenport, 2008; Dove, 1998; Drucker, 1999; Miller, 1977).

The management literature has put a lot emphasis on contextual factors, ways of working and purpose of work. It has recognized motivational aspects of work and discusses ways to motivate and compensate knowledge workers. However, what has remained on a fairly little attention is the inner work life, which is an important driver of knowledge worker's performance (Amabile & Kramer, 2007). Despite all efforts and methods used by the organizations and managers, motivation and performance of a knowledge worker results from "the constant interplay of perceptions, emotions and motivations triggered by workday events, including managerial action" (Amabile & Kramer, 2007, p. 6). Therefore, a central question and challenge for modern management is to better understand how inner work life works and how we can affect personal motivation factors by better understanding the role of emotions in every day work-life.

The aim of this paper is to introduce and connect the concept of inner work life to knowledge-based management research and to contribute by recognizing the antecedents of knowledge work performance from this perspective. The study complements the existing knowledge-based performance management research by linking the emotional aspect of knowledge work to the existing frameworks. The benefits of positive emotions have received a lot of attention in recent years but the potential of negative emotions seems to be neglected in current literature. Negative emotions, such anxiety, fear and guilt are usually seen bad and leading nothing but stress, burnout and depression. However, this paper approaches those emotions from different point of view and suggests negative emotions should not be demonized. This paper considers situations where negative

emotions can lead to positive outcomes at work. Figure 1 presents the research framework for this study.

Figure 1 Research framework for analysing the role of negative emotions at work

This study was conducted using literature review method. Literature search was conducted through Scopus and Emerald using search terms related to emotions (affect, emotion, feeling and mood), words illustrating negative affectivity and emotions based on the hierarchy of basic negative emotions (e.g., negative, anger, anxiety, fear, sadness; see Fleur et al., (2003)) as well as words presenting workplace behavior and outcomes of knowledge work (e.g., performance, creativity, well-being). We first estimated the popularity of our topic by choosing three best ranked knowledge management journals based on the global ranking list of knowledge management and intellectual capital academic journals by Serenko and Bontis (2013). Using the search terms described above, we found zero paper. Thus, it is evident that the positive outcomes of negative emotions are neglected in current knowledge management research. Papers for this study were selected based on title, abstract and keywords. After reading the abstracts, articles were chosen for further analysis. The papers selected for this study investigate either positive and negative emotions or negative emotions alone and their links to the antecedents and consequences of emotions. All of the selected papers needed to have some sort of shift or twist of having positive outcomes from negative emotions and illustrations how negative emotions can be crucial part of creating positive outcomes.

The rest of the paper is organized as following. Section 2 examines previous definitions and frameworks for knowledge work and the performance of knowledge work in order to provide background for the context of this paper. Section 3 reviews the literature related the nature and roles of emotions and affects in organizational context and analyzes various models and theories explaining how emotions are linked to workplace events, behaviors and outcomes. Based on these studies we identify the antecedents and consequences of negative emotions. Section 4 presents the summary and the conceptual model of the emotions in knowledge work performance framework. The

concluding section summarizes the key findings of the paper and suggests directions for further research.

2 Performance of a knowledge worker

In 1959 Drucker proposed that knowledge worker is a person who works primarily with information or is who develops and uses knowledge at workplace (Drucker, 1959). Since then, knowledge work is defined in many ways but there is no generally accepted definition for it in the literature (Dahooie et al., 2011; Kelloway & Barling, 2000). For example, knowledge work has been defined as a profession, a characteristic of individuals, an individual activity and as organizational behavior that include the creation, application, transmission and acquisition of knowledge (see Kelloway & Barling, 2000). According to Davenport (2008), knowledge workers have high degrees of expertise, education or experience, and their jobs consist of the creation, distribution or application of knowledge. The main problem in defining knowledge work is that knowledge has some role in every work (Dahooie et al., 2011). Therefore, the various types and nature of knowledge work are important to understand in order to better manage, measure and improve the activities and performance of knowledge work. Knowledge workers can be classified, for example, based on the level of interdependence and complexity of work (Davenport, 2008), based on the mobility of work tasks (Greene & Myerson, 2011) or along the tacitness and learnability of work practices (McIver et al., 2013).

Performance can be viewed from various perspectives, such as individual work performance, team performance and organizational performance. In this paper, we focus on the work performance of individual knowledge worker. Work performance can be seen as a multidimensional concept, including task performance, contextual performance (or organizational citizenship behavior, OCB) and counterproductive work behavior (CWB) (see, e.g., Koopmans et al., 2013). Viswesvaran and Ones (2000) define work performance as “scalable actions, behavior and outcomes that employees engage in or bring about that are linked with and contribute to organizational goals.” Task performance refers to in-role behaviors that employees perform in exchange for pay. Contextual performance, on the other hand, include extra-role activities such as “volunteering to carry out actions that are not formally part of the job, helping others, following organizational rules or procedures when personally inconvenient, endorsing

and supporting organizational objectives and persisting with extra effort to successfully complete one's task". (Goodman & Svyantek, 1999).

The literature has suggested several performance management and measurement frameworks for approaching knowledge work performance (e.g., Jääskeläinen and Laihonen, 2014; Ramirez and Nembhard, 2004; Ray and Sahu, 1989; Takala et al., 2006; Thomas and Baron, 1994). Takala et al. (2006) approach the performance of strategic work from four aspects: results, process, behavior and physiology. Jääskeläinen and Laihonen (2013) recognize two specific components that relate to performance of knowledge-intensive organizations: performance of a knowledge worker and customer-perceived performance. The strength of these frameworks lies in recognizing the important value drivers (e.g., employee competencies and working atmosphere). More recent literature has stressed the changing nature of work-life and focused increasingly on new and smarter ways of working. This literature deals with the application of non-traditional and flexible work practices, locations and utilization of ICT for carrying out knowledge work (van der Voordt, 2004; Gorgievski et al., 2010; Palvalin et al., 2013; Ruostela et al., 2014). For example, Palvalin et al. (2014) introduced a framework for knowledge work performance in order to analyze and measure the impacts of workplace initiatives, such as office redesigns and mobile working (Figure 2). This framework recognizes contextual factors and personal ways of working as performance drivers. Contextual factors include physical location, virtual and social workplaces as well as organizational context (e.g., Bosch-Sijtsema et al., 2009; Vartiainen, 2007). Whereas contextual factors define the overall atmosphere and support for conducting knowledge work, personal ways of working measures whether the workers are willing or motivated to work efficiently (Ruostela and Lönnqvist, 2013; Koopmans et al., 2013). In this framework, the results and outcomes include well-being at work and productivity.

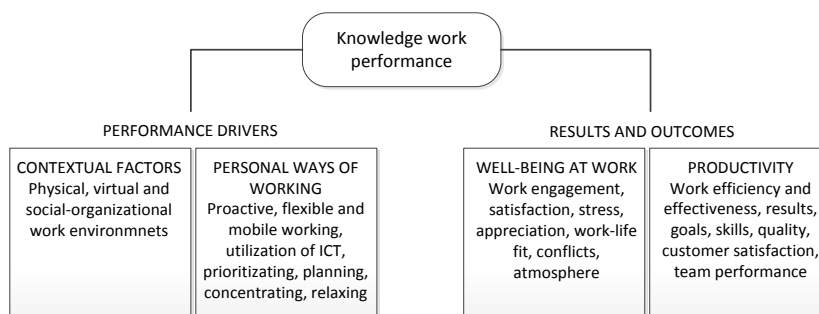

Figure 2. Knowledge work performance (Palvalin et al., 2014).

The framework provides good starting point for examining knowledge work performance as the importance of broader social and contextual elements have been noted in recent work design literature (Morgeson & Humphrey, 2008). However, it lacks the viewpoint of the task context, which provides understanding for the motivational work features, such as autonomy, task variety, significance, job complexity and feedback (Morgeson & Humphrey, 2008). It can be stated that employee's perception on these three aspects (task, contextual factors and individual work practices) affects his/her well-being and productivity. In this paper, productivity is linked to task performance as defined above. Inner work life acts as a mediator between the drivers and outcomes of work as depicted by the research framework presented in Figure 1.

Next, we investigate how emotions are linked to various types of performance drivers and outcomes in the previous literature. In this paper, drivers and outcomes are seen as antecedents and consequences of emotions.

3 Antecedents and consequences of negative emotions in workplace

3.1 Emotions and affect in workplace

Despite the increasing attention of management research towards workplace emotions, literature on knowledge-based management and especially knowledge work performance have paid almost no attention on these very profound phenomena of work life. In order to better understand how human affective experience influences on our work performance it is necessary to shortly present some of the key concepts. Fleur et al. (2003) propose a hierarchy of emotions presented in Figure 3. Emotions (or affects) are divided in to negative (sadness, fear, anger, and shame) and positive (contentment, happiness, love, and pride), which both consists of four basic emotions. Each of these categories of basic emotions contains several more specific emotions.

Figure 3. Hierarchy of basic positive and negative emotions (Fleur et al., 2003).

Fleur et al., (2003) studied consumers' emotions but here the similar categorizations are used for approaching workplace affects. An important distinctive characteristic of emotions is that those are always about something or someone (Cropanzano et al., 2003). This means that emotions have an object of interest or a defining event. This is important from the management perspective, because these objects and events offer concrete objects for management initiatives to focus on. Thus, if we can understand and recognize antecedents of certain emotions we can develop methods to avoid, overcome and harness these affects.

Yet, before proceeding to antecedents it is necessary to understand more about the dynamics of emotional life of human beings. Affect circumplex originally presented by Russell and Feldman Barrett (1999) and further developed by Cropanzano et al. (2003) offers a conceptual tool for studying the nature and dynamics of emotions. The circumplex is presented in Figure 4. Circumplex has two axes: high activation – low activation and pleasant – unpleasant. Various emotions can be categorized to the four quadrats of the circumplex.

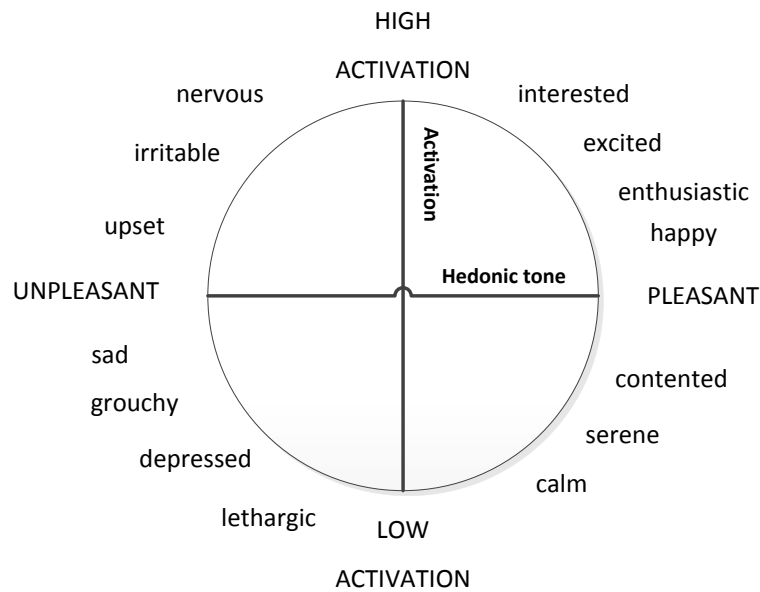

Figure 4. Circumplex of negative and positive affects (Adapted from Cropanzano et al., 2003).

Again from the management perspective it is important to understand, which emotions are so called high activation emotions. Further, it would be useful to have

methods and tools available for feeding these emotions and to provide early warnings when employees are having emotions that would take them to an area of low activation. This turns the question to the affective events that through employees' interpretation processes affect their working motivation and performance (cf. Amabile & Kramer, 2007).

3.2 Identifying antecedents and consequences of negative emotions

In their recent study, Ohly and Smith (2013) systematically identified and classified positive and negative work events. Based on affective events theory (AET), work events are important antecedents of distinct emotions, attitudes, and work behavior. Positive and negative affective work events were sampled from employees using a diary study design. They used concept mapping methodology as an exploratory approach to analyze the data on affective work events. Four positive and seven negative work event clusters were identified:

- Goal attainment, problem solving, task-related success
- Praise, appreciation, positive feedback
- Perceived competence in or through social interactions
- Passively experienced, externally determined positive experiences
- Hindrances in goal attainment, obstacles in completing work tasks, overload
- Conflicts and communication problems
- Technical difficulties, problems with work tools and equipment
- Managerial and internal problems, organizational climate
- Ambiguity, insecurity, loss of control
- Health problems and private issues
- Problems in interactions with clients or patients. (Ohly & Smith, 2013)

Some studies have investigated also the links between affective work events, negative emotions and positive performance outcomes. For example, Spector and Fox (2010) studied affective events as antecedent situations that can lead to the acts of counterproductive work behavior (CWB) and organizational citizenship behavior (OCB). They found that under some circumstances these active behaviors may occur together or sequentially. Using an emotion focused framework (boredom, anger and guilt), they discuss five situations that lead from one form of behavior to the other: Understimulation at work, co-worker lack of performance, organizational constraints, lack of expected

rewards for OCB, and unjustified (to the actor) acts of CWB. Negative emotions played a mediating role to each of these five situations. Understimulation can lead to boredom, co-worker lack of performance, organizational constraints, and lack of expected rewards can lead to anger, all of which can result in CWB. However, engaging in CWB under some conditions can lead to guilt and then OCB. Moreover, both productive and counterproductive extra-task behavior were linked to coping with feelings of boredom. Boredom can be seen as one type of work well-being, together with burned-out, work engaged, workaholic and 9 to 5 (or satisfied). Thus, when investigating emotions at workplace, employee well-being is useful to be defined as a multidimensional concept based on the both positive and negative reactions to job demands and resource. Each type is having different relationships with job and personal characteristics. (Salanova et al., 2014; Shaufeli & Salanova, 2014). It is suggested that boredom that is caused by understimulation can be transformed into positive outcomes.

There are various studies providing evidence on happy productive worker, that is, happiness improves productivity and performance of workers. However, there are also cases investigating angry knowledge workers, which means situations where negative emotions are associated with high performance. For example, Cushen and Thompson (2012) demonstrate that, contrary to mainstream and critical scholarship, skilled technical workers in knowledge-intensive firms can be uncommitted, angry and high performing at the same time. There are also more dynamic views on emotions at workplace. Bledow et al. (2011) present the affective shift model of work engagement that is based on the assumption that both positive and negative affect have important functions for work engagement. The model proposes that a core mechanism underlying the emergence of high work engagement is a shift from negative to positive affect. Work engagement results if people move from a situation in which negative affect is experienced to a state of high positive affect.

Creative performance is one important approach in knowledge work context as knowledge workers are expected to engage in continuous innovation and learning (e.g., Drucker, 1999). Creativity refers to both novelty and usefulness (Davis, 2009). There are models such as a mood-as-input and a dual-tuning perspective that explain conditions under which negative moods are positively related to creative performance (George & Zhou, 2002; George & Zhou, 2007). George and Zhou (2002) found that negative moods were positively related to creative performance when perceived recognition and rewards

for creative performance and clarity of feelings were high. Later George and Zhou (2007) developed a dual-tuning perspective concerning how positive and negative moods interact to influence creativity in supportive contexts. They found that when supervisors provided a supportive context for creativity and positive mood was high, negative mood had a strong, positive relation to creativity, with creativity being the highest when the context was supportive and both positive and negative moods were high. They explored three alternative ways in which supervisors can provide a supportive context: by providing developmental feedback, by displaying interactional justice, and by being trustworthy.

According to Gutnick et al. (2012) negative emotions have been shown to stimulate creative performance through increased persistence and that avoidance-related motivational states can enhance creativity by activating goal-directed behavior. They developed the pressure-creativity model that conceptualizes how pressure triggers challenge and threat appraisals, which in turn influences creativity by shaping employees' cognitive flexibility and/or persistence through pressure.

Table 1 Summary of the literature review

<i>Antecedents</i>	<i>Emotions</i>	<i>Positive Outcomes</i>	<i>Source</i>
Affective work events	Positive and negative emotions	-	Ohly & Smith (2013)
Understimulation, engaging in CWB	Negative emotions (boredom and guilt)	OBC (Contextual performance)	Spector & Fox (2010)
Job demands and job resources	Negative and positive emotions	Well-being	Salanova et al. (2014); Shaufeli & Salanova (2014)
	Affective shift model	Work engagement	Bledow et al. (2011)
	Negative emotion (anger)	High performance	Cushen & Thompson (2012)
	Mood-as-input model	Creative performance	George & Zhou (2002)
	Dual-tuning positive and negative emotions		George & Zhou, (2007)
	Positive, neutral and negative emotions	Creative performance	Davis (2009)
Work pressure	Negative emotions	Creative performance	Gutnick et al. (2012)

4 Summary: Negative emotions in a performance framework

The management literature considers work performance mainly as a straightforward phenomenon and mostly ignores workers individual perceptions and interpretations on the various events and incidents taking place within his/her workplace or its environment.

This paper contributes by highlighting the important role of employees' inner work life as a crucial determinant of work performance (cf. Amabile & Kramer, 2007). It is fairly well understood that positive mood and emotions drive motivation and lead to good performance. Majority of management literature and also management practice concerns ways to motivate and encourage employees to perform better. The other side of the inner work life has received less attention. Thus, the paper focused on negative emotions that are necessarily encountered in each workplace. The main interest of the paper was on the hidden potential of negative emotions, that is, whether there is something that could be turned into business potential or used as a performance driver.

The paper studied the phenomenon based on the literature review and aimed to recognize the antecedents and consequences of negative emotions. Figure 5 summarizes the findings of the literature review and constructs a conceptual framework that will be used as the basis for empirical research later on.

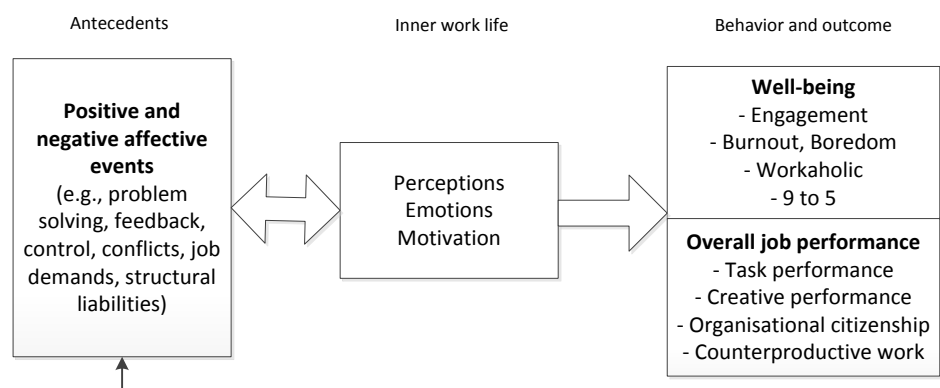

Figure 5 Conceptual model of emotions and knowledge work performance

The main contribution of the paper relates to the conceptualization of the phenomenon in connection to knowledge work performance. Emotions have previously been studied mainly in literatures of work, organization and personnel psychology. Here those are explicitly linked to the management of knowledge work and knowledge-based management more generally.

According to our literature review, there are situations where negative emotions can influence knowledge work performance in positive ways. The findings of the study can be summarized as following:

- 1) Negative emotions related to certain types of affective events, such as understimulation, pressure and previous counterproductive work behavior can lead to positive work behavior and high performance (e.g., Spector & Fox, 2010; Cushen & Thompson, 2012)
- 2) Negative emotions within inner work life can lead to engagement and creative performance through affective shifts and dual-tuning (George & Zhou, 2002; George & Zhou, 2007). There is also a curvilinear relationship between affective intensity and performance (Davis, 2009).
- 3) Negative emotions are related to various types of well-being (Salanova et al., 2014; Shaufeli & Salanova, 2014) and overall job performance of knowledge workers. The type of creative task and contextual perspective are important to take into account when analyzing situations in which negative emotions enhances performance.

5 Conclusions

Despite the increasing interest towards emotions in organization studies, emotions and especially negative emotions still seem to be neglected in knowledge management research. The paper was a first attempt to link these two research streams. The conceptual framework of the paper provides a starting point for the empirical research. It is interesting to see how the empirical findings correlate with the theoretical ideas presented in the paper. Already the very first interviews and other empirical experiences have shown that negative emotions and their antecedents are extremely difficult issues to be studied. However, empirical finding most certainly help in developing the model further. This provides an interesting research task for the near future.

Another future research task relates to the possible value of emotions and especially negative emotions on the renewal capability of knowledge workers and knowledge organizations. Individuals' ability to learn and tolerate continuous change and stress are strongly determined by their inner work life. Thereby, coping with the cognitive load of modern work life necessitates a careful analysis of various affects and emotions in

connection to more traditional approaches of work well-being and knowledge work productivity. A more in-depth understanding about the behavioural outcomes and inner work life discussed in this paper lays the foundation for approaching and improving knowledge workers cognitive capabilities and outcomes.

Further, building on the increased understanding about the phenomenon it is also possible to develop practical methods and tools both for the purposes of individual knowledge workers and managers. A practical tool box of methods for handling affective events causing negative emotions would be highly useful for us all. Thus, this research area relates closely to the management of knowledge assets and intellectual capital and should be discussed more intensively also in the knowledge-based management literature. There are also interesting research openings in the area, which have studied the positive side of negative emotions through emotion regulation and reappraising, which need to be more thoroughly investigated (e.g., Brooks, 2013; Grant, 2013).

Structured Abstract

In this period we are assisting to some news having a strong impact on management of the companies, on reporting and on the standard setters activity. On one side the International Integrated Reporting is attracting more and more attention, not only from many companies, but also from many audit organizations and accounting standard setters. On the other one the management of large the Companies cannot avoid to consider, manage and report about social, environmental and governance issues, and this aspect is affecting the corporate reporting requiring to consider not only the traditional financial dimension, but also these further aspects. One of the main recent innovations about management and reporting is focused on the definition of models for sustainable growth and value creation dynamics according to a sustainable growth perspective. In this way we can find the work of the IIRC that has introduced the Integrated reporting and the Integrated report (IR). IR is strongly based on the concept of Business Model defined as “the chosen system of inputs, business activities, outputs and outcomes that aims to create value over the short, medium and long term”. On this issue, the Technical Task Force of the International Integrated Reporting Council (IIRC) established a Technical Collaboration Group (TCG) prepared the “*Background Paper for <IR>*”. Meantime a pilot program of the IIRC, which involves many companies with the purpose to verify and help the development of the Framework for the Integrated Reporting has been carried on.

The **aim of this paper** is to realize a first explanatory analysis of **Business model** considering three different aspects: the definition stated by IIRC and within its documents, the existing International literature where there is not an univocal definition and the empirical side represented by the Pilot Program of IIRC.

The **research question** is to identify which aspects of the BM should be considered in the light of these different contributions to better represent and report the sustainable growth and value creation dynamics according to a sustainable growth perspective. The paper also has the purpose to put in evidence eventually critical aspects in the BM rules and applications trying to shed more light on how this aspect could be really useful in the

successful development of the Integrated Reporting. This aspect is also relevant since IR represents a recent innovation it is not so much analysed by academics and it would require to be analysed basing on a theoretical perspective.

Three different **methodologies** are adopted: after an explanatory analysis of the International literature review about Business Model we would realize a Document analysis approach (Bowen, 2009) about the documents issued by the IIRC and a Case study approach for the empirical side of the research (Stake, 1993; Yin, 1995). **The empirical side will cover 18 Companies included in the Database of the IIRC.**

The originality of this paper is related both to the fact that it addresses a new issue that is not particularly analysed since it is young and since it is still developing, and to the complete approach of the analysis combining the theoretical aspects with the empirical applications of the companies.

Practical implications of this paper are connected to the fact that the findings could help companies in finding a better way of analysing, implementing and representing their Business Model generating a good outcome both for the entity and for its stakeholders. The results could also be useful for the IIRC that is still developing its standards.

Keywords: business model; integrated reporting; case study; value creation; intellectual capital.

Paper type: Academic Research Paper

1. Introduction and research objectives

One of the main introductory aspects to consider is that accounting and accountability change over years to face different users' requirement (Hopwood A., 1978; Hopwood, A. and Miller, P., 1994; Zambon S., 2002b; Zambon S. and Zan L., 2000). In this period, we can assist to an increasing need of extra-accounting information (also called non-financial information. See Beattie V. and Smith S.J., 2013) sometimes included in specific reports (IC Report, Sustainability Report, ...).

In the latest years an International Organization, the IIRC (*International Integrating Reporting Council*) is trying to reach a convergence by summarizing the main elements of these reports (included the financial report) in an unique report called Integrated Report (IR). This report, strongly focused on the *value creation process* finds one of the key elements in the definition (and connected reporting) of the Business Model (BM) of the entity.

Integrated Reporting represents substantially a recent issue that is still evolving, searching for a proper identity and a widespread adoption in the World, in particular with

reference to larger companies that mainly affect the environment in which they operate (in a wide sense meaning).

IIRC tries to define a model of report that could represent in a concise way the multidimensional performance and risks of the entities, together with their strategy of value creation, in the past, in the present and in the future.

This report has also an hidden purpose. By forcing entities to report such multidimensional analysis obliges them to consider the possible impact that actual actions can generate in the future helping executives and managers in perceiving better results for investors, for stakeholders and for entities themselves.

IR is strongly based on the concept of Business Model defined as “the chosen system of inputs, business activities, outputs and outcomes that aims to create value over the short, medium and long term”. On this issue, the Technical Task Force of the International Integrated Reporting Council (IIRC) established a Technical Collaboration Group (TCG) prepared the “Background Paper for <IR>”.

Meantime a pilot program of the IIRC, which involves many companies with the purpose to verify and help the development of the Framework for the Integrated Reporting has been carried on.

This paper tries to realize a complete exploratory analysis of the three dimensions involved, that are the analysis of the existing literature and of the theory addressing this issue, a study of the rules and definitions supplied by the IIRC and the practical approach of the entities in reporting about their BM.

This paper, as a consequence, combines a bottom-up approach to an upside-down one, trying to find common elements and diversities in the three levels of analysis.

2. Research Method

In this paper we adopt three different methodologies to approach the study of the Business Model proposed by the IIRC.

First of all we realize a deep literature review trying to find the common elements in the definition of Business Model and the elements that are considered to be much important for its understanding and for its reporting. As suggested by Beattie and Smith

(2013; p. 3), “*The concept [of BM] is holistic, multi-level, boundary-spanning and dynamic¹*”.

As a consequence it is not easy to find an unique theoretical background since many contributions arise from the management literature in general (that gave way to a more narrative-based rather than quantitative measure-based²); from the resource-based view (RBV) theory, from the strategic management perspective³ and from the dynamic capabilities concept.⁴ Another stream of research impacting on the BM can be found in the literature on strategic competitive advantage and in particular to the one specifically addressing, the business model^{5 6}.

Beattie and Smith (2013; p. 4) also add that, “*the frameworks and models were developed largely from management practice, and included little in the way of formal theory*”. As a consequence it is necessary to adopt not only a theoretical approach, but also an empirical one to complete the analysis under all different point of view.

After the literature review the paper will compare the Framework proposed by the IIRC with the contributions arising from the first step of analysis trying to find the communalities, the element of the definition proposed consistent with the different theories and the elements that could be useful to introduce with the purpose of completing the definition allowing to supply useful information for the users of the reports describing the BM.

The research method adopted for this step is the *document analysis*, considered as a qualitative research method (Glenn A. Bowen, 2009). Our paper is based on the analysis of the following documents:

- ✓ *The International <IR> Framework by IIRC*
- ✓ *Background Paper <IR> Business Model*

Other documents considered to complete the analysis and to facilitate the comprehension and comparison of the previous documents are the following ones:

¹ “*It is further shown that key concepts in the strategic management literature can usefully inform the business reporting debate. The analysis supports the current calls for integrated disclosure around the central business model story*”.

² *Beattie and Smith (2013; p. 11)*

³ *Developed in the 1980s and early 1990s by Wernerfelt (1984) and Barney (1991).*

⁴ *For a recent review about the RBV, see Barney & Clark (2007). About the Dynamic capabilities concept see Barreto (2010).*

⁵ *This literature emerged in the mid-1990s along with the rise of the Internet (Zott, Amit & Massa, 2011, p. 1022).*

⁶ *As suggested by Beattie and Smith (2013), “However, as Teece (2010) notes, the concept has no established theoretical basis in either the economics or the business disciplines. Since then, research using the concept has exploded, as documented in a recent review of the business model literature (Zott et al., 2011)”.*

- ✓ *Background Paper <IR> Value Creation*
- ✓ *King Code of Governance for South Africa 2009*
- ✓ *King Report*
- ✓ *The Broad Based Business Reporting, (The Institute of Chartered Accountants - Australia)*
- ✓ *GRI (The Sustainability Reporting Guidelines)*
- ✓ *BIS (2011)*
- ✓ *BIS (2012)*
- ✓ *UK Corporate Governance Code*
- ✓ *IFRS (about Business Model).*

The document analysis involved three steps: to skim the documents (superficial examination), to read (thorough examination) and to interpret (Glenn A., 2009) them. This analysis also aims to point out contradictory aspects, general patterns and different positions emerging from the documents and attributable to the different subjects investigated (Glenn A., 2009; Bowen, 2008).

As Beattie and Smith put in light (2013; p. 8) to classify the Business Model it is useful “*either a bottom-up taxonomy grounded in real-world examples or a top-down typology generated from theory*”. For this reason the research consists also in a third step in which we analyse the case studies of description of the BM within the Integrated Report realized by companies participating to the Pilot Program of the IIRC and selected by the IIRC itself ⁷. These contributions can be found at the website ⁸ and comprise an extract of 19 reports made by 18 companies. These reports refer to 2011, 2012 and 2013. This means that not all these documents can be consistent with the recent documents issued or published by the IIRC.

The adoption of the case study methodology seems to be particularly consistent with the purpose of this paper. It in fact addresses a new issue (“the focus is on a cotemporary phenomenon within a real-life context” (Yin, K., 2009; p. 2). Of the same advice Beattie and Smigh (2013; p. 3) that specify: “*Siggelow (2007) argues that the use of case studies in this way is valuable as it provides concrete examples of constructs and offers the opportunity to get closer to these theoretical constructs and the relationships between them. Using this approach, the present paper responds to Bukh’s call. It is concluded*

⁷ In the website of IIRC.

⁸http://examples.theiirc.org/search?x=31&y=6&organisation_type=&organisation_region=&organisation_industry=&report_type=&report_year=&fragment_content=7

that the business model concept offers a powerful overarching concept within which to refocus the IC debate”.

The analysed case studies (*multiple case study approach*), try to give a reply to these questions:

- ✓ Are the report consistent with the definition supplied by the IIRC?
- ✓ Which elements of these reports can be considered useful to improve the current definition supplied by the IIRC?

3. The importance of business model in corporate reporting

In recent years Business Model gained importance in narrative reporting and it is currently getting a lot of attention. The business model has been incorporated in recent financial reporting regulations. The term “Business Model” is incorporated in:

- ✓ IFRS 9 paragraph 4.1: “Chapters 4 and 5 of IFRS 9 specify how an entity should classify and measure financial assets, including some hybrid contracts. They require all financial assets to be:
 - classified on the basis of the entity’s business model for managing the financial assets and the contractual cash flow characteristics of the financial asset.
 - initially measured at fair value plus, in the case of a financial asset not at fair value through profit or loss, particular transaction costs.
 - subsequently measured at amortized cost or fair value”.
- ✓ UK Corporate Governance Code in its last version (2010, p. 18, section C.1.2), specifies: “the directors should include in the annual report an explanation of the basis on which the company generates or preserve value over the longer term (the business model) and the strategy for delivering the objectives of the company.
- ✓ In 2013, FASB, in its proposal for financial instruments, proposed a similar use of business model for classifying financial instruments, but in January 2014 FASB abandons converged approach to Business Model assessment.
- ✓ The concept of Business Model was introduced by IASB into the accounting of deferred taxes, in 2010, with amendments to IAS 12.
- ✓ EFRAG (European Financial Reporting Advisor Group), published a bulletin, in July 2013, on The role of Business Model in Financial Reporting, in association with

French ANC, German ASCG, Italian OIC and UK FRC⁹, with a comment deadline of 30 September 2013. The research paper was issued in December 2013 with a comment deadline of 31 may 2014.

The bulletin presents the meaning of the term Business Model, assumed by EFRAG and others accounting authority. This terms is undefined in IFRS literature. The bulletin provides a conceptual discussion as to whether Business Model is essential for the key characteristics in the IASB Conceptual Framework: two fundamental qualitative characteristics, *relevance* and *faithfully representation* and fours enhancing qualitative characteristics, *comparability*, *verifiability*, *timeliness* and *understanding*. Timeliness and verifiability characteristics has not considered relevant in their discussion. They explain the term “business model as the value creation process of an entity, i.e. how the entity generates cash flows”. Through this definition, they conclude that it is difficult to meet these objectives if the business is ignored in financial reporting. It is time for a change and it should be included in Conceptual Framework with appropriate guidance for standard setting because Business Model can play a role in Conceptual Framework. It can play a role also in recognition of assets, in measurement and in presentation and disclosure.

4. Literature Review

The concept of business model is relatively recent. According to Osterwalder, Pigneur and Tucci, in 1957 it has been used for the first time, without neither a theoretical framework was provided, nor its definition was supplied. We had to wait years 70’s to see the first discussions on the BM (Ghaziani & Ventresca, 2005). Beginning in the 90’s the first definition will appear. The following table sets out the recent key definitions in the literature on Business Model.

1	<i>Brandenburg er & Stuart (1996)</i>	The total value creation of a business model is the total value for all business stakeholders such as customers, partners and, suppliers.
2	<i>Slywotzky (1996)</i>	The totally of how a company selects its customers, defines and differentiates its offering, defines the tasks it will perform itself and those it will outsource, configures its resources, goes to market, creates utility for customers and captures profits”.

⁹ EFRAG (2013) *Conceptual Framework Bulletin The role of Business Model in Financial Reporting*.
<http://www.efrag.org/Front/p290-2-272/Conceptual-Framework---Bulletin--The-role-of-the-business-model-in-financial-reporting.aspx>

3	<i>Timmers (1998)</i>	An architecture of the product, service and information flows, including a description of the various business actors and their roles; a description of the potential benefits for the various business actors; a description of the sources of revenue.
4	<i>Linder and Cantrell (2000)</i>	The organisation's core logic for creating value.
5	<i>Gordijn et al. (2000)</i>	A business Model answer the question: who is offering what to whom and expects what in return? A Business Model explains the creation and adding value in a multipack stakeholder network as well as the exchange of value between/stakeholders.
6	<i>Torbay et al. (2001)</i>	The organization's architecture and its network of partners for creating, marketing, and delivering value and relationship capital to one or several segments of customers in order to generate profitable and sustainable revenue streams.
7	<i>Amit & Zott (2001)</i>	A business model depicts the content, structure, and governance of transactions designed so as to create value through the exploitation of business opportunities.
8	<i>Weill & Vitale (2001)</i>	A description of the roles and relationships among a firms consumers, customers, allies and suppliers that identifies the major flow of product, information and money, and the major benefits to participant.
9	<i>Applegate (2001)</i>	A description of a complex business that enables study of its structure, the relationships among structural elements, and how it will respond in the real world.
10	<i>Fisken and Rutherford (2002)</i>	The business model outlines how a company generates revenues with reference to the structure of its value chain and its interaction with the industry value system.
11	<i>Chesbrough & Rosenbloom (2002)</i>	The business model provides a coherent framework that takes technological characteristics and potentials as inputs, and converts them through customers and markets into economic inputs. The business model is thus conceived as a focusing device that mediates between technology development and economic value creation.
12	<i>Magretta (2002)</i>	The business model tells a logical story explaining who your customers are, what they value, and how you will make money in providing them that value.
13	<i>Bouwman (2002)</i>	A description of roles and relationships of a company, its customers, partners and suppliers, as well as the flows of goods, information and money between these parties and the main benefits for those involved, in particular, but not exclusively the customer.
14	<i>Bray (2002)</i>	The business model is defined by the performance drivers, business processes, people and infrastructure put in place to achieve business objectives.
15	<i>Chesbrough & Rosenbloom (2002)</i>	The heuristic logic that connects technical potential with the realization of economic value.

16	<i>Dubosson-Torbay, Osterwalder and Pigneur (2002)</i>	The architecture of a firm and its network of partners for creating, marketing and delivering value and relationship capital to one or several segments of customers in order to generate profitable and sustainable revenue streams.
17	<i>Hedman & Kalling (2003)</i>	Business model is a term often used to describe the key components of a given business. That is customers, competitors, offering, activities and organization, resources, supply of factors and production inputs as well as longitudinal process components to cover the dynamics of the business model over time.
18	<i>Chaharbaghi, Fendt & Willis (2003)</i>	Define Business Model as a representation of management thinking and practices that help business see, understand and run their activities in a distinct specific way.
19	<i>Seddon et al. (2004)</i>	A business Model outlines the essential details of a firm's value proposition for its various stakeholders and the activity system of the firm uses to create and deliver value to its customers.
20	<i>Osterwalder (2004)</i>	A conceptual tool that contains a set of elements and their relationships and allows expressing a company's logic of earning money.
21	<i>Shafer et al. (2005)</i>	A representation of a firm's underlying logic and strategic choices for creating and capturing value within a value network.
22	<i>Osterwalder et al (2005)</i>	A conceptual tool that contains a set of elements and their relationships and allows expressing the business logic of a specific firm. It is a description of the value a company offers to one or several segments of customers and of the architecture of the firm and its network of partners for creating, marketing, and delivering this value relationship capital, to generate profitable and sustainable revenue streams.
23	<i>Morris et al. (2005)</i>	A business model is a concise representation of how an interrelated set of decision variables in the area of venture strategy, architecture and economics are addressed to create sustainable competitive advantage in defined markets.
24	<i>Osterwalder, Pigneur and Tucci (2005)</i>	A business model is a conceptual tool that contains a set of elements and their relationships and allow expressing the business logic of a specific firm. It is a description of the value a company offers to one or several segments of customers and architecture of the firm and its network of partner for creating, marketing and delivering value and relationship capital, to generate profitable and sustainable revenue streams.
25	<i>Tikkanen et al. (2005)</i>	Business Model can be conceptualized as the sum of material, objectively existing structures and process as well as intangible, cognitive meaning structures al the level of a business oragnization.
26	<i>Andersoon et al. (2006)</i>	Business models are created in order to make clear who the business actors are in a business case and how to make their relations explicit. Relations in a business model are formulated in terms of values exchanged between the actors.

27	<i>Kallio et al. (2006)</i>	The means by which a firm is able to create value by coordinating the flow of information, goods and services among the various industry participants it comes in contact with including customers, partners within the value chain, competitors and the government.
28	<i>Rajala & Westerlund (2007)</i>	The ways of creating value for customers and the way in which a business turns market opportunities into profit through sets of actors, activities, and collaborations.
29	<i>Brousseau, & Penard (2007)</i>	The business model as a pattern of organizing exchanges and allocating various costs and revenue stream so that the production and exchange of goods or services become viable, in the sense of being self-sustainable on the basis of the income it generates.
30	<i>Seelos & Mair (2007)</i>	Business Model is a set of capabilities that is configured to enable value creation consistent with either economic or social strategic objectives.
31	<i>Laudon and Traver (2008)</i>	A business model is a set of planned activities (sometimes referred to as business processes) designed to result in a profit in a marketplace”.
32	<i>Janseen et al. (2008)</i>	A business model reflects the core business of an organization and is useful to describe (and even prescribe) the organization from the perspective of its main mission, and the products and services that it provides to its customers.
33	<i>Amit & Zott (2008)</i>	The business model is a structural template of how a focal firm transacts with customers, partners and vendors; that is, how it chooses to connect with factor and product markets. It refers to the overall gestalt of those possibility interlinked boundary-spanning transactions.
34	<i>Doganova & Eyquem-Renault (2009)</i>	The business model is a narrative and calculative device that allows entrepreneurs to explore a market and plays a performative role by contributing to the construction of the techno-economic network of an innovative.
35	<i>Demil and Lecocq (2010)</i>	“Business model as, the description of the articulation between different business model components or building blocks to produce a proposition that can generate value for consumers and thus for the organization”
36	<i>Baden-Fuller et al. (2010)</i>	The logic of the firm, the way it operates and how it creates value for its stakeholders.
37	<i>Al-Debei & Aviston (2010)</i>	The business model is “an abstract representation of an organization, be it conceptual, textual, and/or graphical, of all core interrelated architectural, cooperational, and financial arrangements designed and developed by an organization presently and in the future, as well all core products and/or services the organization offers, or will offer, based on these arrangements that are needed to achieve its strategic goals and objectives”.

38	<i>Svejenova et Al. (2010)</i>	An organizational devise that reveals a company's logic for creation and capturing value did also its approach to constant renewal.
39	<i>Wikström et al. (2010)</i>	Business models describe the organizations activities and how deliver value to the costumer and strategy decides how the business model is utilized by considering competition and thereby stressing the need to position.
40	<i>Johnson (2010)</i>	The essence of business model as a representation for how a business crates and delivers value both for the costumers and the company.
41	<i>Teece (2010)</i>	In essence, a business model is a conceptual, rather than financial, model of the firm.
42	<i>Osterwalder & Pigneur (2010)</i>	The business model is like a blueprint for a strategy to be implemented through organizational structures, processes and systems.
43	<i>Sorescu et al. (2011)</i>	A business model is a well-specified system of interdependent structures, activities, and processes that serves as a firm's organizing logic for value creation (for its customers) and value appropriation (for itself and its partners).

From these definitions arising from the literature about Business Model emerges that many of them are not going particularly in depth about and are not always easy to represent a guidance for entities who want to report about BM. There is in some ways a sort of lack between these definitions and the empirical possibility to transform them in concrete report of the entities.

5 Business model for Integrated Reporting

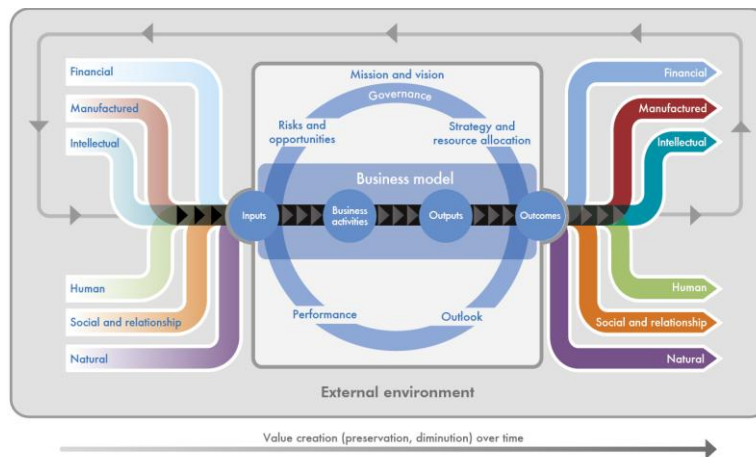

In a first step, we should explain the definition of business model provided in two recent publications of the IIRC: *Background Paper <IR> Business Model* released in March 2013¹⁰ and *The International <IR> Framework by IIRC* released in December 2014.

The *International <IR> Framework* supplies this definition: "An organization's business model is its system of transforming inputs, through its business activities, into outputs and outcomes that aims to fulfill the organization's strategic purposes and create value over the short, medium and long term. The key elements of an IR Business Model are inputs, business activities, outputs and outcomes"¹¹.

¹⁰ The paper was edited by CIMA (Chartered Institute of Managements Accountants), IFAC (International Federation of Accountants) and Pwc.

¹¹ The international <IR> Framework (2013, p. 25). <http://www.theiirc.org/international-ir-framework/>

This first definition is important because considers Business model as a **system that transforms resources through its business activities.**

“The organization should identify key inputs, and to the extent that they are material to understanding the robustness and resilience of the business model, how they relate to the capitals on which the organization depends¹², or that provide a source of differentiation. The discussion should include a concise, meaningful account of how these inputs link to opportunities and risks, strategy and performance” (*Background Paper <IR> Business Model*, 2013, p. 11).

Activities, the heart of Business Model, convert “inputs into outputs through business activities. These activities may include the planning, design and manufacture of products or the deployment of specialized skills and knowledge in the provision of services” (*Background Paper <IR> Business Model*, 2013, p.13).

Organizations should identify their key products and services. There are, potentially, other outputs, such as waste and other by-products, that may also need to be discussed within the business model disclosure depending on their materiality”. It also “should explain the key outcomes that arise from their business activities, outputs and effect on the capitals. Outcomes can either be internal or external to the organization and ordinarily require consideration of the entire value chain, rather than that owned or controlled simply by the organization”(Background Paper <IR> Business Model, 2013, p.13).

¹² <IR> identify six capitals possible in input in an organization, financial capital, manufactured capital, human capital, intellectual capital, natural capital and social and relationship capital.

“Features that can enhance the effectiveness and readability of the description of the business model include:

- ✓ Explicit identification of the key elements of the business model.
- ✓ A simple diagram highlighting key elements, supported by a clear explanation of the relevance of those elements to the organization.
- ✓ Narrative flow that is logical given the particular circumstances of the organization.
- ✓ Identification of critical stakeholder and other (e.g., raw material) dependencies and important factors affecting the external environment.
- ✓ Connection to information covered by other Content Elements, such as strategy, risks and opportunities, and performance (including KPIs and financial considerations, like cost containment and revenues)”.
The key element of the IIRC’s definition of Business model are:

SYSTEM >> transform INPUT (resources, capitals) >> by ACTIVITIES (process) >> >> into OUTPUT and OUTCOMES >> to fulfill CREATION VALUE over time

Comparing the definition supplied by the IIRC with the 44 previously analysed we can see that some of them are telegraphic or that do not presents more elements than the IIRC’s definition (1/4/5/13/15/16/19/21/22/29/34/36/39/41/43). In others definitions there is a lack in the key element of Input or Activities (3/7/8/9/10/11/17/20/24/25/26/7/28/31/32/33/35/37/38/40). On the contrary, the IIRC definition seems to be more close to some definitions of literature (2/6/12/14/18/23/30/44).

6 Business Model within the IR of the Companies participating to the Pilot Project

In the following table we analyse the extract of the IR addressing BM as selected by the IIRC in its website. The dimensions selected are the ones emerging from the short documents and summarized as follows:

Entity and Year	N. of pages	Explication of the kind of business	Schema of BM	Main Resources	How to implement resources	How to implement value creation	Dynamic Dimension and forward looking information	Other aspects
ACCA 2012	4	Not specifically	No	Yes	Yes	Yes	Not specifically	Mission
ARM 2011	2	Yes	No	No	No	Not specifically	No	No
Cima 2012	2	No	No	Yes	Yes	Yes	Not specifically	No
Fibria 2011	2	Yes	Yes	Not explained	No	No	No	Governance
Gold Fields 2012	2	Not specifically	Yes	Not complete	Yes	Yes	Not specifically	No
Hyundai E & C 2012	2	No	Yes	Yes	Yes	Yes	Not specifically	Management policy; Green value; Social value; Economic value
Indra 2011	4	Yes	Yes	Yes	Yes	Yes	Not specifically	No
New Zealand Post 2013	2	No	No	No	No	No	Not specifically	Scorecard Targets
Sasol 2011	2	Yes	Yes	Yes	Not specifically	Not specifically	Not specifically	No
Sasol 2012	2	Yes	Yes	Yes	Not specifically	Not specifically	Not specifically	The document is not a copy of the one of the previous year
Smithfield 2012	6	Yes	Yes	Yes	Yes	Yes	Yes	How to face risks
Standard Bank 2011	2	Yes	No	No	No	Not specifically	Not specifically	Key financial ratio
Stockland 2012	2	Not specifically	Yes	Yes	Not specifically	Yes	Not specifically	Value chain schema
The Crown Estate 2013	2	Very short	Very short	Very short	Very short	Very short	Not specifically	No
Transet 2013	4	Yes	Yes	Yes	Not specifically	Not specifically	Not specifically	Financial highlights, Economic, social and environmental dividends
Tullow Oil 2011	2	Yes	Yes	Not specifically	Not specifically	Yes	No	No
Vancity 2011	2	Yes	Yes	Yes	Yes	Yes	No	No

Vodacom 2012	2	No	No	No	No	Yes	No	Schema of “what we live for”
Xastra 2011	2	Yes	Yes	Not specifically	Not specifically	Yes	Not specifically	Working partnership

In this analysis the locution “not specific” is also considerable as a synonymous of “not in depth”.

From this analysis we can see that the majority of the documents contains descriptive information and not economic not perceptual quantification. There is a clear lack in the narrative information that is substantially ignored within the documents analysed ¹³. Information is generally regarding the past or the current year whereas it is not explaining the future dimensions. It is in some ways a static information more than a dynamic one ¹⁴.

The number of pages devoted to the BM are quite limited (generally only two pages). Only some of the entities introduce a schema of the BM. Many of them explain the main resources involved but in a very synthetic way.

There is not, in general, an analysis of the dynamic of the sector and of the main competitors ¹⁵.

Another substantially missing aspect is represented by the description of merger and acquisition operations or other operations of partnership with other entities ¹⁶.

¹³ Beattie and Smith (2013; p. 10), analysing the existing literature put in light as follows: “Mouritsen, Larsen & Bukh (2001) note that narratives permit the mechanisms of value creation to be accounted for more freely than numbers. Examples include the balanced scorecard developed by Kaplan & Norton (1992) and Sveiby’s (1997) Intangible Assets Monitor. Some writers view such frameworks as offering possible templates for business model reporting (Nielsen, Fox & Roslender, 2012)”.

¹⁴ Beattie and Smith (2013; p. 8): “Alternatively, or additionally, the distinction could be viewed in terms of a static strategy versus a dynamic business model, emphasising the role of dynamic capabilities in a transformational business model (Demil & Lecocq, 2010)”. (P. 19): “The business model can be used in static sense or in a dynamic sense, as business models change due to internal and external factors, related to markets, technologies and institutions. Dynamic business model descriptions capture this process of change (Demil & Lecocq, 2010). Since the interviewees were not specifically asked about change aspects related to IC and value creation, it is unsurprising that only a few mentioned such aspects (Teece et al., 2007)”.

¹⁵ Beattie and Smith (2013; p. 8): “the ICAEW’s (2010) report on business models in accounting, which focusses on the economic theory of the firm. The business model reflects management intentions. It describes what a firm does internally versus what it does through the market”.

¹⁶ Beattie and Smith (2013; p. 18): “Boundary-spanning partnering such as this allows both parties to share resources, costs and risks and/or serves to develop dynamic competitive capabilities and mitigate environmental dynamism by fostering dynamic learning mechanisms (Yaprak, 2011; Li et al., 2013). The crucial importance of boundary-spanning value creation activities was identified by several interviewees, in terms of their relationships with suppliers”.

Also the matter of the opportunities and risks is substantially neglected within the analysed reports ¹⁷.

In some ways we can say that these extracts of the reports represent a first attempt of describing a Business Model, whereas a very deep improvement seems to be necessary to reach the purposes defined by the IIRC that is considering the BM as the key element to explain the value creation process in the short and in the middle and long period.

7 Conclusions and further developments

From this exploratory analysis we can derive that there has been a great progress in the understanding of the Business Model and in its role in the value creation process. Basing on different theoretical backgrounds, BM literature gradually and increasingly shifted to a convergence specializing on the BM itself. The definitions analysed put in evidence how deep and important is the issue and how it is developing in recent years.

From the analysis we also can see that the definition supplied by the IIRC is quite useful and complete for the purposes of managing and reporting the value creation process. In some ways the definition supplied is generally more wide than the others offered by the literature addressing the BM issue. Such definition and all the documents issued by the IIRC could be further developed after analyzing the results of the Pilot project.

From the empirical side, on the contrary, it seems that entities are just able to run over this issue, avoiding to go in depth and to give to many information to the users of the report. It seems to be at an early stage of the BM reporting and the main aspects emerging from the analysis seem to be the following ones. The narrative part is really too short to allow the reader to understand the way in which resources, relationships, risks and other aspects are managed, also in the light of the internal and external dynamic processes. There is a lack of information about how the business is really managed and which changes and risks could happen in the next future. It is difficult to find a narrative exposition and a quantitative representation that could put in evidence the results achieved (possibly under the economic, social and environmental dimension).

Further developments of this research could be represented by a deep investigation of the future empirical side, also with the purpose to try to find a bridge between the upside

¹⁷ See AICPA, 1994.

down and the bottom up approach (from the theory to the practical aspects, but also from the empirical data to a theoretical approach).

Structured abstract

Purpose — The purpose of the paper is to explore the question of alignment between knowledge strategy and business model. These two elements are considered as a central parts of organizational strategy at early stages of start-up development. The empirical investigation of the alignment of business model and knowledge strategy is the main long-term objective of this study. However in this paper we concentrate on theoretical foundations of the alignment between knowledge strategy and business model.

Design/methodology — This study uses ground theory as a general approach. As the context of the study we choose Russian IT start-ups. This choice of this setting is driven both by specificity of the setting that makes it easier to indicate particular practice or instrument.

Originality/value – There are several things by which our research adds value for management theory. First, we integrate two important domains of strategy research, which is crucially important for the development of the field. Second, we clarify the concept of knowledge strategy and its' formulation. Next, we explain the process of business model development in very specific settings. Finally, main theoretical concepts are considered at the startup stage.

Practical implications – The perspective discussed in this work also has important managerial implications, as it represents a bridge between academic research and managerial practice. The reason for this is the topic itself, which has high priority in managerial and entrepreneurial practice. Moreover, qualitative method used depicts real managerial practice rather than purely theoretical constructs. We also provide directions for the start-uppers on the issue of the development of knowledge strategy and business model. Moreover, we explain the importance of the alignment between these two issues. Finally, we give directions on how it should be done.

Keywords – knowledge strategy, business model, IT start-up, alignment

Paper type – Academic Research Paper

1 Introduction

The issue of alignment and fit is one of the most important areas of the management research (Venkatraman, 1989; Walter et al., 2013). The most of the attention to the alignment issue in current research is given to the alignment between internal and external environment (Miller, 1992) or between strategy and operational functions (Henderson and Venkatraman, 1993; Ma et al., 1998). It is also possible to find an inquiry on knowledge strategy and strategy alignment (Zack, 1999; Asoh et al., 2008; Tounkara et al., 2009). Some of the researchers also underline that knowledge management itself is an instrument of alignment. The same things are said about business model. Some studies (Van de Ven and Walker 1984) in the strategy field emphasize the role of strategic design as a framework for business modeling and its importance for the survival and success of new ventures (Teece, 2010; Casadesus-Masanell & Ricart, 2010).

Business model are frequently considered as a social artifact that helps entrepreneur communicate to potential investors

(Verstraete and Jouison-Laffitte, 2011). Business models (BM) include theory and assumptions about customer behavior and agency. (Baden-Fuller and Haefliger, 2013). A business model reflects management's hypothesis about what customers want, how they want it and what they will pay, and how an enterprise can organize to best meet customer needs, and get paid well for doing so (Teece, 2010). Put differently, business model refers to the logic of the firm, the way it operates and how it creates value for its stakeholders (Casadesus-Masanell & Ricart, 2010; Zott, C., Amit, & Massa, 2011; Sabir et al, 2012). By business model, we posit so, the way by how an organization converts a given set of strategic choices in order to create and capture this value (Smith et al., 2010). Osterwalder et al. (2005) point out also that business model provides conceptual alignment of the different functional areas. He indicates that knowledge management also has a function of alignment in the organization by provision of the knowledge integration between different parts and levels of organization (Timmers, 1998; Osterwalder et al., 2005).

Thus, an interaction between knowledge strategy and business model can be a critically important step in integration of strategy research. The integration of the different areas is crucially important for further development of strategy research (Jemison, 1981). Moreover, study of alignment seems to be the most promising in terms of the explanation of the performance differences among the organizations, which is the basic question of strategic management. And a business system, in essence, is the way a company defines

and differentiates its offers, defines the activities that properly match its strategy, selects its processes, configures and allocates its resources, enters the market, creates utility for its actual and potential customers (Lopes and Martins, 2006).

2 Business Model concept

In recent years, the business model concept has been the focus of attention from both academics and practitioners. This concept also has been the subject of an incremental number of practice-oriented studies.

The term “business model” was first used in the context of data and process modeling (Osterwalder, Pigneur et al 2005), and it became the established expression among those working in the emerging new technologies sector at the end of the 1990s. Later this definition was extended to managerial and academic spheres. Generally speaking, business models define how the pieces of a business fit together (Magretta 2002). The increased usage of the BM term is highly correlated with the emerging of web business, globalization and contract manufacturing (Bellman et al. 1957, Osterwalder et al. 2005). The alterations that were responsible for its development were not only technological, the economic factors (e.g. way of value creation) and the regulatory factors also played important role (Redis, 2007).

Business model concept has been discussed in the context of different disciplines, including economics, innovations, management, strategy, e-business, and entrepreneurship (Amit and Zott, 2001; Hedman and Kalling, 2003; Teece, 2010) and that could partly explain the reason why business model concept become the victim of complexity (Weill, Malone, and Apel, 2011).

Thus, Osterwalder (2004) provides a detailed analysis of business model literature and gives the following definition: a business model is a conceptual tool that contains a set of elements and their relationships and allows expressing a company’s logic of earning money. Following to Osterwalder, Pigneur, and Tucci (2005), a business model addresses the relationship between business strategy, organizational structure, and the available technological resources.

In this vein, Osterwalder developed the Business Model Canvas – specific method for business modeling. This method consists of business model blocks (components), which are: value propositions (the goods and services offered); key activities (the most important activities); key resources (the resources for creation the value for the customer); partner

network (relationships considered essential to accomplishing the value proposition); customer segments (target market(s) intended to be served); channels (channels of distribution); customer relationship (the type of relationship the firm wants with its customers); cost structure (characteristics of the cost and expense); revenue streams (the way the firm makes money).

The research on business model has focused primarily on two complementary streams: taxonomies of business models and definitions of components of business model.

WWW-boom period gave crucial opportunity of creating values in very different ways for customer's demands (Amit and Zott, 2001). Business model has break down into various parts. For instance, Osterwalder, Pigneur and Tucci, (2005) suggest nine modules; Mason and Spring (2010) - three components, Johnson, Christensen, and Kagermann (2008) offer four parts of business model. Thus, in literature we can find and other researchers presented various dimensions of business model.

In essence, business model frameworks classification based on the value proposition and revenue generation mode. Business model compiled with elements and referred as building blocks.

The review of the received literature on business models reveals that scholars do not agree on what a business model is. However, the common issue to the most of existing research is defining business models with an emphasis on how a firm makes money. Scholars have also highlighted that the business model can play an important role in a firm's strategy. For example, Richardson (2008) mentioned that the business model explains how the activities of the firm work together to execute its strategy. Following Casadesus-Masanell and Ricart (2010), the business model is a reflection of a firm's realized strategy.

The terms 'strategy' and 'business model' often are viewed as interchangeable (Magretta 2002). Mistakenly, the both these terms are used for referring to everything that gives to the organization a competitive advantage (Stahler 2002). A literature review revealed that while business models and strategy are connected, they are distinct from each other (Mansfield and Fourie 2004). One of the key differences that is underlined in current literature is that business model represents how the pieces of the organization fit together, while the strategy focuses on competition (Magretta 2002). By contrast, Seddon et al. (2004) follow different view on distinguishing between business model and strategy, defining the business model as an abstraction of a firm's strategy. However, this approach

is inferior in current business literature.

We can also illustrate the business model as a storytelling about the business that is focused on how pieces fit together; while the strategy is more about describing how the firm differentiates itself and deals with competition. The important consequence of the idea that business models do not consider the firm's competitive positioning is that any business model is potentially applicable to many different firms. Another difference between strategy and business models is that strategy includes execution and implementation, while the business model is more about abstract description of the business functioning as a system. An important conclusion from this is that a 'strong' business model can be managed poorly and fail, just as much as a 'weak' business model may succeed due to strong management and implementation skills (Osterwalder et al. 2005). A business model, in essence, makes explicit the underlying economic logic that defines how the firm creates value, but it doesn't provide an implementation plan.

Business model, in certain way, is a representation tool for explicating a firm's current or future value creation and value-capturing logic (e.g. Shafer et al. 2005), also BM serves as a structured template for how to transact with business partners (e.g. Amit and Zott 2001), and as a cognitive framework for translating technological input into economic output (e.g. Chesbrough and Rosenbloom 2002), finally, as a narrative device for structuring discourses throughout new venture creation processes (e.g. Doganova and Eyquem-Renault 2009).

Business model is inherent to every firm, whether it is a new venture or an established player (Magretta 2002), because business model locates the firm's value network, defines how it transacts with customers and partners, and the products that are exchanged.

3 Business Model Innovation

The innovation of business models is one of most challenging tasks for managers (Chesbrough 2006; Christensen and Raynor 2000) as both rapid technological and environmental changes proceed (Johnson et al. 2008). The risks and high costs associated with changing the existing business model place the task for innovation at management and strategic departments (Peterovic et al. 2001). Understanding a new business models for companies and helping to design and measure them are important research issues, not so well covered until now.

To profit from innovation, managers need to surpass not only at product innovation

but also at business model design, understanding business design options as well as customer demands and technological trajectories. Innovating with business models will not give a competitive advantage, but new business models, or improvements to existing ones, can give an opportunity to generate higher returns to the business pioneers (Teece 2010). The business model innovation can itself become a competitive advantage only if the business model is sufficiently differentiated, difficult to replicate and aligned with organizational strategy.

In most of cases, the need for a new business model often emerges from a serious crisis concerning the firm and its existing business model (Johnson, Christensen, & Kagermann, 2008). So designing sustainable business model is a challenging innovation task. More and more companies nowadays are using business model innovation as an alternative or complement methods to product or process innovation. Innovation at the level of the business model can convey into a sustainable performance advantage if it is aligned with the competitive strategy of the organization.

Many authors mentioned that business model innovation refers to the search for new ways to create and capture value for its stakeholders, and finding new ways to generate revenues and define value propositions for customers and partners (e.g., Amit and Zott 2001; Magretta 2002; Zott and Amit 2007, 2008; Baden-Fuller et al. 2008; Casadesus-Masanell and Ricart 2010; Gambardella and McGahan 2010; Teece 2010). And as a result, business model innovation affects the whole enterprise (Amit and Zott 2001). And more important - innovative business models - can provide the basis for sustainable business success, even in competitive environment with well-established incumbents (Casadesus-Masanell & Zhu 2012). But the key to the effective business model innovation is an alignment between business model and competitive strategy.

4 Business models and knowledge management

There are several ways in which business model and knowledge management concepts are interrelated. First of all, capturing, storing, and following business models in a company are a form of knowledge management that will increasingly gain importance. The world becomes more global and hypercompetitive and in this case competitive advantage often depend on success in managing business model knowledge.

Second, an important point in managing business model is describing it explicitly. In knowledge management this process is known as externalization: articulating tacit knowledge into explicit knowledge (Nonaka et al. 1995).

Next, knowledge management can be an instrument for business model and competitive strategy alignment. As knowledge management supports an integration of knowledge across organization, it allows connecting business model knowledge with competitive strategy knowledge.

Moreover, knowledge strategy in a high extent represents competitive strategy of the organization. This is especially true for knowledge intensive organizations. The mechanism of this representation can be explained as following. The decision about how company compete is reflected by its' strategies for knowledge sourcing, knowledge sharing, knowledge creation, etc. All these decisions about knowledge in organization are driven by the decision about ways of competition. Actually, they directly represent this ways of competition with focus on organization's knowledge.

5 Knowledge strategy

Basing on review of the prior research (Bierly and Chakrabarti, 1996; Zack, 1999; Earl, 2001; von Krogh et al., 2001; Casselman and Samson, 2007; Sawabe and Egashira, 2007; Denford and Chan, 2011) we identified key components of knowledge strategy. Key components that were identified are following: knowledge focus, knowledge advantage, knowledge domain width, knowledge domain novelty, knowledge boundaries of organization, knowledge protection, codification/personalization orientation, disaggregation, organization of knowledge flows, knowledge valuation.

Considering specificity of knowledge management in entrepreneurial firms, we can make accent on two main issues. First of all, the idea that in small entrepreneurial firms knowledge management in huge extent is externally oriented (Sparrow, 2001; Hutchinson and Quintas, 2008). Second, that small firms manage their knowledge mostly in informal ways (Hutchinson and Quintas, 2008).

Finally, drawing upon the idea of knowledge – strategy alignment (Zack, 1999) and the idea of knowledge capabilities of Casselman and Samson (2007), who propose two major types of capabilities: knowledge process capabilities and knowledge infrastructure capabilities, we propose the concept of strategic knowledge capability. Strategic

knowledge capability represents a framing of M. Zack's (1999) idea of knowledge – strategy alignment as a dynamic capability (see Teece, 1997, 2007).

As it was said before knowledge management and business model concepts have several possibilities for integration. However, we decided to concentrate on knowledge strategy issue. This is done for several reasons, first of all, both business model and knowledge strategy can be considered as dimensions of strategy in holistic view on organization. Moreover, knowledge strategy is probably is the only strategy that is visible in early stages of startup development. For example Morecroft et al (2006) build their model of growth strategy for biotechnology startup around strategic view on organizational knowledge. Finally, knowledge strategy has special importance for knowledge intensive firms.

6 Design and methodology

The object of the study is IT startups. There are several reasons for that. First, there are more possibilities to discover the process of alignment. Next, at this stage most of companies shape both business model and knowledge strategy. The survival and success of IT startups depends on effective business model design and implementation. The business model of a new venture defines as the way of “how [the firm] plans to make money long-term” (Afuah and Tucci, 2001, p. 4). So in this context the business model has become “the method of doing business by which a company can sustain itself” (Rappa, 2001, p. 1) by expressing the value proposition, identifying the market segment and core competence etc. The successful business model becomes an example to be imitated or compared. And at this point it shapes not only the specific new venture that it represents, but also, through the process of replication, business models and new ventures come (Doganova & Eyquem-Renault, 2009).

Young and new technology-based companies typically face growth challenges characterized by intense product and/or process innovations—frequently combined with business model innovations. This requires originality, strategic vision, and new ways of defining the value proposition and delivering it to the customers, through the innovative development of business models (Christensen and Rosenbloom 1995; Chesbrough and Rosenbloom 2002; Chesbrough 2004). Business model innovation per se is increasingly identified as the real differentiator in conceiving and delivering novelty to the market (Johnson et al. 2008). In the fast-moving technology market space, product innovation without business model innovation may not provide enough competitive advantage. (Amit

and Zott, 2012). Relationships between different players give access to new knowledge and also enable young companies to focus on core activities where they have distinctive knowledge.

Representative of business community in Russia frequently point out (in Mass Media and personal talks) that most of Russian IT start-ups have unique technological skills, however they fail because they don't think about their business model. The most of the IT new ventures are started by students with technological background. And the lack of collaboration between technological universities and business-schools can partly explain high rate of failure. In such case, than IT and business students do not have natural environment for interaction, it becomes especially important which knowledge strategy IT start-up will follow. The knowledge sourcing and knowledge sharing decisions have high impact on the development of managerial capabilities of IT start-ups. And we believe that at conditions of the hypertrophied chasm between IT and business students the process of the alignment between knowledge strategies and business model becomes more visible, because the start-up team need to decide how to acquire lacking knowledge. Thus the question is how knowledge strategy and business-model shape each other in the start-up. This question actually can be split into two parts: 1) how knowledge strategy influence on formulation of the business model; 2) how business model formulation change knowledge strategy.

To answer this question we decided to use grounded theory approach (Strauss and Corbin, 1998) and the multi-case method (Eisenhardt, 1989). We conducting several semi-structured interviews with heads of IT start-ups. As we do not have access to the start-ups at the moment than idea was born, we conduct retrospective interviews. And the data analysis is held according to the procedure offered by Strauss and Corbin (1998). The coding of each data source is done independently by two researchers. In addition specially trained master student does the coding of the same materials to make it less dependent on prior assumptions and more objective.

Structured Abstract

Businesses today use enormous resources to search for Intellectual Capital (IC) that can value their Business Model Innovation. However business often focus the search for IC in their nearest Business Model Ecosystem and do often not “see” and “sense” valuable IC in BM ecosystems that are not or only peripheral related. Thereby many business rely their business model innovation on the same “pool” of IC – preventing them to release different IC that could eventually give valuable advantage to their business. Some research indicate that it is a good idea to search for IC in different BM Ecosystems – however there is a lack of research on Why this does not take place more and - How to release and relate to Intellectual Capital (IC) in BM Ecosystems that are different to those that the business is already operating in? The paper shows 3 case examples on how 3 different business relates to IC in different BM Ecosystems and value their business model innovation. The paper address the potential and challenges to release IC from different Business Model Ecosystems.

Design/methodology/approach - The paper provides case studies of IC exchange between different BM ecosystems. It shows a map of different business model ecosystems and maps the challenges to releasing IC.. The research methodology was chosen as to be an action research approach and was carried out from 2010 to 2014. The findings shows characteristic of different BM Eco systems related to the multi business model approach (Lindgren & Horn Rasmussen, 2013). Mapping our findings in a BM ecosystem perspective and the BM relation axiom enabled us to get a first picture of - What is the business BM relations to IC in different BM ecosystems? The mapping enabled us and

the business to “see” and “sense” potentials but also challenges to release valuable IC to Business Model Innovation (BMI) from different BM Ecosystems?

Originality/value - The paper illustrates how business by using IC from different BM Ecosystems potentially can improve their BMI results and the sustainability of their BMs. The research reveals that Business mainly focusing and releasing IC internal or from their nearest BM ecosystem prevents themselves from valuable BMI.

Practical implications Business struggle with releasing valuable IC from their business BM's. The research shows that they potentially could get valuable IC from different BM ecosystems that are outside their BM Ecosystem. This is however a challenge to many businesses when they cannot “see” and “sense” the IC in different BM ecosystems. They hereby miss the opportunity to adapt important IC to develop their business and escape “red ocean” business model ecosystems (Chan and Mahoughne 2008, Markides 2008). One consequence of this is that the practice of multi business model innovation and releasing intellectual capital (IC) becomes more difficult and complex to carry out than necessary.

Paper type – Academic Research Paper

Keywords.: BM Eco systems, Intellectual capital, Relations, Multi Business Models, relationship axiom

1. Introduction

Business Model Ecosystems (BME) and Intellectual Capital (IC) have not had substantial attention by academics and practitioners. BM ECO systems have however been the subject of a growing research interest in our research center “Multi Business Model Innovation and Technology ” (MBIT) because we found that there is very little knowledge about how BM Eco systems are constructed and function together but there is much knowledge of Business models (Zott 2010,Fielt 2011, Teece 2011, Lindgren 2013).

IC practice and the release of IC between BM Eco systems and how to release IC both directly and/or indirectly between BM Ecosystems have not been a special focus of BM research. Further there is little knowledge of what are the barriers to release IC between BM Ecosystems and why this valuable IC is not released.

Before commencing the study we have to acknowledge firstly that there until now is no accepted language for BM ECO system's that would allow us as researchers to examine BM Ecosystems. We therefore have to build such language and propose a language for BM Ecosystems - to approach a preliminary study of BM Eco system and their exchange of IC. The paper therefore commence with studying present knowledge on the definition of what a ecosystem and later a BM eco system is. Then the paper continue

to give a first attempt to how could a BM Ecosystem be defined and finally present different case studies of BM Eco systems on behalf of this framework.

In this context we build upon a comprehensive review of academic literature on eco systems and ecosystem frameworks, where we attempted and explored the origin of the term ecosystems. This literature basis we relate to our Multi Business Model framework (Lindgren 2013). The broad and multifaceted literature review reveals us with several insights, and enables us further to develop our BM Eco system definition and answering later the overall research question – What are the barriers to release IC between Bm Ecosystems.

2 Research question

For managers of business our previous research shows that the discovering of their business different BM's relations in the Business (Lindgren 2011) seems to inherent revelatory information and unreleased IC. The basic according to our research is firstly to let the business “see” their “AS – IS BM's” relations and then start “seeing” and “sensing” BMI relations potential to the business. Therefore it is interesting to address the following questions

How can a BM ecosystem be defined?

What are BM ecosystems relations to IC?

What are the barriers to release IC between BM eco systems?

How can business release IC between BM Eco systems?

3. Empiric illustrations and data analysis

We have chosen to illustrate from different research project where the majority of the projects are further elaborated in the “sister-paper” to this paper (Horn Rasmussen et.al. 2014). Consequently, we have been going from theory to the different case in order to identify potential links which makes sense. Such methodology doesn't verify any theory. However, the indications tell us that we might have some results which give meaning for the search for a research program in the Lakatos sense. We are aware of our verifying focused methodology must go close in hand with the proposed ontology and we are aware

of a need to try to “shot our hypothesizes down”. However, this is not part of the mission of the paper.

4. Defining a BM Eco system

When studying literature on Ecosystems and Business Ecosystems many researchers take their point of entry from a bio ecological perspective. We commence our study from this point of entry and try to draw an analogy and comparison to the term BM Eco system.

The term "ecosystem" was introduced by Arthur Roy Clapham in early 1930s and became more widely known via the works of Arthur Tansley, a British ecologist(Tansley 1934). Tanslev devised the concept to draw attention to the importance of transfers of materials between organisms and their environment. He later refined the term, describing it as "The whole system..."including not only the organism-complex, but also the whole complex of physical factors forming what was called “the environment”. Tansley regarded ecosystems not simply as natural units, but as mental isolates. Tansley later defined the spatial extent of ecosystems using the term ecotope.

The term “Business Ecosystem” was introduced by Moore (Moore 1993) in his Harvard Business Review article, titled "Predators and Prey: A New Ecology of Competition". Moore defined "business ecosystem" as:

“An economic community supported by a foundation of interacting organizations and individuals—the organisms of the business world. The economic community produces goods and services of value to customers, who are themselves members of the ecosystem. The member organisms also include suppliers, lead producers, competitors, and other stakeholders. Over time, they coevolve their capabilities and roles, and tend to align themselves with the directions set by one or more central companies. Those companies holding leadership roles may change over time, but the function of ecosystem leader is valued by the community because it enables members to move toward shared visions to align their investments, and to find mutually supportive roles.”

Moore used several ecological metaphors, suggesting that the business could be regarded as embedded in a (business) environment, that it needs to coevolve with other businesses, and that “the particular niche a business occupies is challenged by newly arriving “entrants” ” (Porter 1985). This meant that businesses need to become proactive

in developing mutually beneficial ("symbiotic") relationships with customers, suppliers, and even competitors.

DeLong (DeLong 2000) defined business ecology as "a more productive set of processes for developing and commercializing new technologies" that is characterized by the "rapid prototyping, short product-development cycles, early test marketing, options-based compensation, venture funding, early corporate independence".

G. Evelyn Hutchinson combined Charles Elton's ideas about trophic ecology with those of Russian geochemist Vladimir Vernadsky to suggest that mineral nutrient availability in a lake limited algal production which would, in turn, limit the abundance of animals that feed on algae. Raymond Lindeman took these ideas one step further to suggest that the flow of energy through a lake was the primary driver of the ecosystem. Howard T. Odum and Eugene P. Odum, further developed a "systems approach" to the study of ecosystems, allowing them to study the flow of energy and material through ecological systems. (Odum 1953).

We suggest that competences – which includes IC in a BM - availability in a BM Ecosystem limit BM Innovation (BMI), which would, in turn, limit the abundance of businesses and thereby BM's that feed on competences. The flow of value from e.g. IC through a BM Eco system is one driver of a BM Ecosystem. Values from IC flow not just internal through relations internal BM's - but also between BM's internal the business and BM ecosystem – the relationship axiom (Lindgren 2013). Then BM ecosystems are related to values also between BM Eco systems. Fundamentally value and thereby IC value from IC cannot flow without a relation. The study of value flow between BM Eco systems becomes hereby interesting to answer our research question. However to do the study a deeper understanding of a BM ecosystem, its relations and its BM's relations is fundamental.

An ecosystem is regarded as a community of living organisms (plants, animals and microbes) in conjunction with the non living components of their environment (things like air, water and mineral soil), interacting as a system. A BM Ecosystem is proposed as a "community of businesses" offering "AS IS BM" and proposing "TO BE BM" in conjunction with their BM environment.

These biotic and abiotic components of an ecosystem were regarded as linked together through nutrient cycles and energy flows. As ecosystems are defined by the network of interactions among organisms, and between organisms and their environment, they were

said to be of any size but usually encompass specific, limited spaces (Chapin 2002, Schultze 2005) although some scientists say that the entire planet is an ecosystem). (Willis 1997, Schultze 2005, Krebs 2009). The biotic and abiotic components of a BM Ecosystem are proposed as linked together through value cycles and BMI flows.

Energy, water, nitrogen and soil minerals are essential abiotic components of an ecosystem. Competences (Technology, Human resource, organisational systems and culture) (Lindgren 2010) are essential dimensions of a BM Ecosystem. Competence of a BM Ecosystem that are valued, can be found and developed makes the BM Ecosystem attractive to relate to other BM Ecosystems – and hereby the amount of competences can grow – but also diminish related to the values content.

The energy that flows through ecosystems is obtained primarily from the sun – regarded maybe as another Ecosystem outside the ecosystem of the earth – maybe include in the Ecosystem – depending on the viewpoint and context of the ecosystem. Value that flows through BM Ecosystems is obtained from other BM's inside the BM Eco systems – sometimes from BM's in different BM ecosystems outside the BM Ecosystem.

Energy - from the sun - generally enters the system through photosynthesis, a process that receive, creates, captures, and consume carbon from the atmosphere. Value– from another BM Ecosystem – must generally enter the BM Ecosystem through a value innovation process – A Business Model Innovation process. A BMI proces that create, captures, delivers and consume received value when optimum enrich the competences in BM's in the BM Ecosystem.. However if the value and herunder IC outside the BM Ecosystem cannot relate to a BM Ecosystem or the BM Ecosystem cannot relate to other BM Ecosystem then the BMI process cannot and will not take place. Further if the BMI process in the BM Ecosystem does not fit to the offered value then the BMI process cannot or will neither take place. Essentially values form one BM Ecosystem must give meaning to another BM Ecosystem, it must give value and it must be able to transfer via established relations.

By feeding on plants and on one another, animals and humans play an important role in the movement of matter and energy through ecosystems. By feeling on BM's and on one another, competences play an extremely important role in the movement and innovation of value and hereby IC through BM Ecosystems and between BM Ecosystems.

In Ecosystems animals and humans influence the quantity of plant and microbial biomass present. By breaking down dead organic matter, decomposers release carbon back to the atmosphere and facilitate nutrient cycling by converting nutrients stored in dead biomass back to a form that can be readily used by plants and other microbes. (Chapin 2002) - abiotic components. Competence influence the quantity and quality of BM's present. By breaking down dead or old BM's other BM's can release value from e.g. IC back to the BM ecosystem and facilitate new value innovation and development of competence cycling by converting competences stored in old or dead BM's to a form that can be used by other BM's and other BM Ecosystems.

Ecosystems are often considered as controlled both by external and internal factors. External factors such as climate, the parent material which forms the soil and topography, control the overall structure of an ecosystem and the way things work within it, but are not themselves influenced by the ecosystem(Chapin 2002). BM Ecosystems are also considered controlled by external and internal factors (Porter 1985)

Other external factors can include time and potential biota from other Ecosystems. Ecosystems are however dynamic entities—invariably, they are subject to periodic disturbances and are in the process of recovering from some past disturbance(Chapin 2002). BM Ecosystems are also dynamic entities, and they are also subject to periodic disturbance – oil BM Ecosystem, solar Energy BM Ecosystem.

Ecosystems in similar environments that are located in different parts of the world can have very different characteristics simply because they contain different species (Chapin 2002). Equivalent similar BM Ecosystems in different parts of the world have different characteristics s can be seen in the wind energy BM ecosystem in EU, China, US and South America.

The introduction of non-native species can cause substantial shifts in a ecosystems function. Introduction of new entrants (Porter 1985) or radical new BM's (Christensen 2005) to a BM Ecosystem can also cause substantial shifts in the BM Ecosystems function (Ryanair introduction to flight industry, Led Light in buble light industry). Evolvement of non-native BM's in new BM Ecosystem's can simply disrupt existing BM Ecosystem because they take value away from some BM Ecosystem and even change or destroy the control system of old BM Ecosystems (Itunes, Amazone, Facebook, Ikea, Schale gas and Oil).

Internal factors not only control ecosystem processes but are also controlled by them and are often subject to feedback loops (Chapin 2002). BM Ecosystems processes are also controlled by internal factors which effects the BM Ecosystems value and IC exchange processes – and hereby BMI. Summing up on the fundamentals to IC release between BM Ecosystems gives the following list.

Table 1. Fundamentals to value and IC release between BM Ecosystems.

Value offered from different BM Ecosystem must give meaning to the other BM Ecosystem.
Relations between BM, Business and BM Ecosystems must be established
There are competences in one BM Ecosystems BM's that are attractive to another BM Ecosystem
One BM Ecosystems wants, need or demand exchange of value and IC from different BM Ecosystem
BM Ecosystem control processes enables relations and are willing to enable relation to be established
BM Competence are free – not restricted or prevent to exchange to other BM Ecosystem
BMI competences are available in BM Ecosystem

While the resource inputs are often said to be generally controlled by external processes like climate and parent material in an ecosystem, the availability of these resources within the ecosystem is often controlled by internal factors like decomposition, root competition or shading. Other internal factors include disturbance, succession and the types of species present. Although humans exist and operate within ecosystems, their cumulative effects are large enough to influence external factors like climate (Chapin 2002). The value inputs and competence development to a BM Ecosystem can also be regarded as controlled by external processes like government and society – but maybe more important mentally by the participants in the BM Ecosystem – the BM's. However the availability generally of BM's competences – tangible or intangible – within the BM Ecosystem is often controlled by internal factors like competition, rivalry, entry and exit barriers (Porter 1985), patents and degree of openness (Chesbrough 2008), ownership and ownership rules, trust, culture, motives (Child and Faulkner 1998). Although competence exist and operate within BM Ecosystems, and we as researchers can see that the cumulative effect are large in specific BM Ecosystems and even between BM Ecosystems – this often is not enough to release value and IC due to both internal and external factors.

Biodiversity affects ecosystem function, as do the processes of disturbance and succession. Ecosystems provide a variety of value propositions upon which animals, people and things depend. Multi dimensionality and difference (Saghaug 2010) of BM's,

Business and BM Ecosystems can also affect BM Ecosystems functions and ability to do BMI. Processes of disturbance and change of succession in BM's dimensional construction, businesses and BM Ecosystems can provide a variety of new vital value propositions upon which BM, business and BME can evolve and survive. Classifying ecosystems into ecologically homogeneous units has until now be considered as an important step towards effective ecosystem management, but there is no single, agreed-upon way to do this. However the practise within classification, clustering and even society support of BM Ecosystems has previous been the same – dividing BME into clusters, industry sectors, innovation networks (FI 2013). Hereby controlling and supporting BM Ecosystem to be separated and preventing them to relate, “see”, “sense” each other – and exchange valuable IC.

An ecosystem consists in a biological term ((Willis 1997, Schultze 2005, Krebs 2009) as a biological community that can occurs in some locale, physical and/or chemical factors that make up its non-living or abiotic environment. There are many examples of ecosystems -- a pond, a forest, an estuary, a grassland. The boundaries are not fixed in any objective way, although sometimes they seem obvious, as with the shoreline of a small pond. Usually the boundaries of an ecosystem are chosen for practical reasons having to do with the goals of the particular study. The same can be stated related to BME's – where again there is often no natural boundaries – but just mental boundaries.

The study of ecosystems mainly consists of the study of certain processes that link the living, or biotic, components to the non-living, or abiotic, components intern a ecosystem. This is also the case with BM Ecosystem's however the majority of work have been on business and BM Ecosystem level – not between BM eco systems and internal BM's.

Energy transformations and biogeochemical cycling are the main processes that comprise the field of ecosystem ecology. Value transformationis the main processes that comprise the field of BM system ecology. Ecology generally is defined as the interactions of organisms with one another and with the environment in which they occur. BM ecology is defined as the value interactions of organisms and things with one another and with the BM Eco system in which they operate “AS IS” BM's and wants to operate – “TO BE BM's”. We can study ecology at the level of the individual, the population, the community, and the ecosystem. We argue that we can also study BM ecosystems at the level of BM component, BM dimension, BM, BM portfolio, Business and BM Eco system level.

Studies of individuals are concerned mostly about physiology, reproduction, development or behavior, and studies of populations usually focus on the habitat and resource needs of individual species, their group behaviors, population growth, and what limits their abundance or causes extinction. Studies of communities examine how populations of many species interact with one another, such as predators and their prey, or competitors that share common needs or resources. Studies of BM's have until now concerned mostly about BM construction (Osterwalder 2010, Zott 2011, Teece 2012), Business Model innovation (Chesbrough 2008, Zott 2010, Zott 2011, Osterwalder 2010, Taran 2011). There is a major lack of studies on the habitat and competence needs of individual BM's, BM's group behaviors, BM Eco Systems growth and decline, and what limits their abundance or causes extinction. Studies of BM Ecosystems examine how populations of how many BM's – BM Eco systems - interact with one another, such as predators and their prey, or competitors that share common needs or IC is still lacking.

In ecosystem ecology all of the above mentioned are put together and tried to be understood to find out how eco systems operates as a whole. Until now BM Ecosystem ecology have been put together and tried to be understood mainly as from a business theorem perspective and how the BM ecosystem operates as a whole in an industry (Porter 1985), sector (or cluster perspective examines a region's industry clusters, economic infrastructure, market dynamics and policy climate. A cluster is classical regarded as a group of businesses sharing resources, using similar technologies, and forming linkages and alliances. These linkages can take the form of buyer-supplier relationships, turnover and using same pole of employees, joint marketing, training, or research initiatives, associations, and lobbying. One of the unique features of cluster analysis is the focus on linkages between businesses, and on implications for shared strategies – often called "Co-opetition" – in which businesses selectively compete in some respects (say, in output markets) yet cooperate in other respects (say joint training programs).

This means - in an Ecosystem perspective - that, rather than worrying about particular species, researchers try to focus on major functional aspects of the ECO system. These functional aspects include such things as the amount of energy that is produced by photosynthesis, how energy or materials flow along the many steps in a food chain, or what controls the rate of decomposition of materials or the rate at which nutrients are recycled in the system. In an BM Ecosystem perspective – rather than worrying about

particular BM's we in this paper try to focus on major functional aspects of BM Ecosystems and the challenges and barriers to exchange of IC. We focus on the the amount and quality of BM's that is created, captured, delivered, received and consumed in a BM Ecosystem. In this context how values and IC flow between BM Ecosystems or what controls the rate of decomposition of Values and IC between BM Ecosystems.

From the above mention we can clarify and compare the parts of an ecosystem by listing them under the headings "abiotic" and "biotic" components. Related to a BM Eco system w propose to do a first attempt of clarification by listing them under th headings of "values" and "Competences".

Table 2. Fundamentals to value and IC release between BM Ecosystems.

Ecosystem		BM Ecosystem	
Abiotic components	Biotic components	Value dimension	Competence dimension
Sunlight	Primary producers	Products	Technologies
Temperature	Herbivores	Services	HR
Precipitation	Carnivores	Processes	Organizational Systems
Water or moisture	Omnivores	Value Chain	Culture
Soil or water chemistry (e.g., P, NH ₄ ⁺)	Detritivores	Business Models	
etc.	etc.	etc.	etc.

All of these vary over space and time both for Ecosystems and for BM Ecosystems. By and large, this set of components and dimensions – BM Ecosystems environmental factors is important almost everywhere, in all ecosystems - in BM Ecosystems and Between BM Ecosystems. Energy enters the biological ECO system as light energy, or photons and is transformed into chemical energy in organic molecules by cellular processes including photosynthesis and respiration, and ultimately is converted to heat energy. This energy is dissipated, meaning it is lost to the system as heat; once it is lost it cannot be recycled. Without the continued input of solar energy, biological systems would quickly shut down. Thus - the earth is an *open system* - with respect to energy. IC enters BM Ecosystems as values and creates valuable energy transformed into into "BMI energy" in BM components – attitudes created by attributes – which are the real drivers to any BMI processes. Without the continued input of value and IC BM's, Business and BM Ecosystems would as in species in Ecosystems also quickly dye and vanish Form the BM Ecosystem.

Elements such as carbon, nitrogen, or phosphorus enter living organisms in a variety of ways. Plants obtain elements from the surrounding atmosphere, water, or soils. Animals may also obtain elements directly from the physical environment, but usually they obtain these mainly as a consequence of consuming other organisms. These materials are transformed biochemically within the bodies of organisms, but sooner or later, due to excretion or decomposition, they are returned to an inorganic state. Often bacteria complete this process, through the process called decomposition or mineralization.

Values and IC also enter BM's, Business and thereby BM ecosystems in a variety of ways – but always through relations. BM Ecosystems obtain value and IC from surrounding BME's and from BM's inside the Ecosystem. BM Ecosystems can therefore grow from value and IC obtained from inside the BM Ecosystem or obtain from outside the BM Ecosystem. These values and IC are transformed in the BME within the BM's, but equivalent – sooner or later - due to “excretion or decomposition” BM's value and competence are also returned to an inactive state – dead BM's or “sleeping” values and IC. These dead BM can however on a later perspective turn out to be valuable – if they can be found and released – to BMI and new BM.

During decomposition these materials are not destroyed or lost, so the earth is a **closed system** with respect to elements (with the exception of a meteorite entering the system now and then). The elements are cycled endlessly between their biotic and abiotic states within ecosystems. Those elements whose supply tends to limit biological activity are called **nutrients**.

During decomposition the components of any BM's have until now been considered as they could not be destroyed or lost. Any BM Ecosystem have been considered until late 2000's (Chesbrough 2008) also been considered as closed BM Ecosystems, however with respect to new BM's or BM dimensions (a disruptive BM (Christensen 2005) or a new Entrants (Porter 1985) entering the BM Ecosystem. The BM's value and IC can therefore also be considered as cycling endlessly between BM's in the BM Ecosystem.

Table 3. Comparing Fundamentals of Ecosystems and BM Ecosystems.

• Ecosystems	• BM Eco systems
• Ecosystems are made up of abiotic (non-living, environmental) and	• BM Ecosystems are made up of “AS IS” and “TO BE” BM and dead BM's

<p>biotic components, and these basic components are important to nearly all types of ecosystems. Ecosystem Ecology looks at energy transformations and biogeochemical cycling within ecosystems.</p>	<p>and these basic BM are important to nearly all types of BM Ecosystems. BM Ecosystem studies looks at value and IC transformation and cycling within and between BM Ecosystems.</p>
<ul style="list-style-type: none"> • Energy is continually input into an ecosystem in the form of light energy, and some energy is lost with each transfer to a higher trophic level. Nutrients, on the other hand, are recycled within an ecosystem, and their supply normally limits biological activity. So, "energy flows, elements cycle". 	<ul style="list-style-type: none"> • Value are continually input into a BM Ecosystem in the form of technology, HR, organizational systems and culture. Some value and IC are lost with each transfer because there is no relation, receiver, capturing BM or a BM that can consume the Value or hereunder the IC.
<ul style="list-style-type: none"> • Energy is moved through an ecosystem via a food web, which is made up of interlocking food chains. Energy is first captured by photosynthesis (primary production). The amount of primary production determines the amount of energy available to higher trophic levels. 	<ul style="list-style-type: none"> • Value is moved through a BM Ecosystem via relations, which is made up of interlocking relations components. Value is created, captured, delivered, received and consumed by a BMI process consisting of primary and secondary functions (value chain functions) carried out by competence inside the BM or competences outside the BM.
<ul style="list-style-type: none"> • Ecosystem function is controlled mainly by two processes, "top-down" and "bottom-up" controls. 	<ul style="list-style-type: none"> • BM Ecosystem function is controlled mainly by two processes, "top down" and "bottom up" controls.

5. BM Eco system case research

A BM ecosystem is context based related to topic, time, actor and viewer. The case shows different context and BM Ecosystems of the renewable energy market.

5.1. Renewable Energy BM Eco system (RE)

The market for renewable energy is rising all over Europe due to the vision "Re-thinking 2050" by the European Renewable Energy Council (EREC 2010). EREC launched a plan called "Re-thinking 2050" in April 2010, where the vision was to have a 100% renewable energy in 2050 for all the European countries. Professor Arthouros Zervos, president of EREC stated that "We do not inherit the Earth from our ancestors: We borrow it from our children", and he further argued that the technology is ready for this changes, why is it more a choice of taking the right decisions for the future, then taking the easily road (Zervos 2010). 97 % of the electricity consumed shall come from

high renewable energy sources such as solar, wind, biomass, geothermal etc. This high renewable energy sources should have 75 % of the gross final energy consumption (Memo 2010). Hereby Zervos indicated that European energy challenges should be solved by different BM Ecosystems (Solar-, wind, Biomass, geothermal etc.) supply of Energy and each BM Ecosystem should do BMI to reach the vision. However Zervos do not mention release and exchange of IC between different BM Ecosystems. Therefore it often seems that the different BM ecosystems in renewable energy market seems to focus on BMI and IC release within the BM Ecosystem and not between. Further it seems as the individual BM Ecosystems regard themselves as competitors to each other and together to fossil Energy BM Ecosystem. This could explain sometimes why BMI is not moving faster towards archiving the vision – simply because the individual BM Ecosystems do not exchange IC or maybe do not see valuable IC in each other BM Ecosystem.

5.2. The Danish and global Wind Industry BM Ecosystem (DWI)

Globally, the Danish Wind Energy BM Ecosystem is a part of the Global wind energy BM Ecosystem and holds a quarter of the total global turnover. In 2013 the Danish wind energy BM Ecosystem exports saw a minor drop to 48.7 billion DKK (6.5 billion EUR) compared to 52.3 billion DKK (7 billion EUR) in 2012. (DWI 2014) The global BM Ecosystem grew however by 35.3 GW to a cumulative capacity of 318 GW by the end of 2013. This development was driven by China and USA (28.7 percent and 19.2 percent of the total MW installed). BM related to the Danish Wind Energy BM Ecosystem stand therefore at the forefront of new BM ECO System reality where new and different IC is highly needed. New competing BM ecosystems enters the BM energy ecosystem, new business models turns up, new business model rules and regulations and new BM relationships points to a transition towards rethinking and innovating the existing practise of releasing intellectual capital in the Wind BM Ecosystem. For the purpose of this paper related to the Wind Energy BM Ecosystem the challenges is to create, capture, deliver, BM's that continuously are becoming greener. In this transition, a great deal of BMI opportunities lie open for those business and societies businesses ready to fill and understand identified gaps through developing their own sustainable green BM's within the new BM Ecosystem market reality of amongst other low-carbon and new BM values.

The European market is the largest in the world when it comes to offshore turbines (Marcacci 2013). The Chinese market have had an upturn in 2013 (Wind 2014) because

the Chinese government was giving a large subsidy to the wind turbines that are installed in China. (Berger) foresight that this BM Ecosystem called APAC market is reaching 1.5GW of new annual capacity additions worth €4.8 billion by 2020. (Marcassi 2013). Berger further foresight Canada, America, and Mexico to be home of 500MW annual capacity additions reaching a total investment of €1.6 billion by 2020

This all means that the BM Eco system for renewable energy based on Wind Energy is very attractive and many businesses are interested in getting a piece of the BM ecosystem, estimated to over 1470 billion euros in EU. However the wind BM ecosystem not only as we have seen above compete internal but also compete with other BM Ecosystems as solar, biomass, geothermal and other renewable energy sources. This also means that there is focus on BMI in the renewable BM Eco system, where different BM Eco systems are interrelated and competing each other to get the largest piece of the renewable energy market. Accordingly in 2050 the estimates are that Wind Energy BM Ecosystem will dominated the EU market with 1552 TWh. As second is Photovoltaic (PV) with 1347 TWh and then biomass with 496 TWh. The estimates are further that for Wind Energy BM ecosystem they will need to invest 6 billion euros over the next 10 years, which will mean releasing existing and new IC from different BM eco systems. This will lead the Wind Energy BM Ecosystem to contribute with up to 20 % of the EU electricity by 2020 and 33 % by 2030. As seen in figure

Figure 1. LCoE 2012 European generation mix.

2), today's wind turbines are not the most cost-effective energy source. The graph shows the leveled cost of energy (LCoE) in the different BM Ecosystems in the BM

Energy ECO system. Look at onshore turbines BM's the cost is 6-8 euro-cent per kilowatt-hour (kWh) produced. Today (2013) the offshore turbine LCoE BM's is 13 euro-cent per kWh. The offshore wind turbines BM's are more expensive due to the large size and problem with logistics. Further is it costly to set offshore turbines in ever-deeper waters. Never the less does Berger (Berger 2014) states that: *"The offshore wind businesses will become increasingly important in the years ahead"*

Because Wind energy comes in very unstable due to the wind the Wind Energy have found and interest to relate to other BM Ecosystems to find IC that can help and support in e.g. developing Energy Storage devices, convert electricity to other types of energy types – Gas, Hydrogen. Also reduction of subsidies to the BME Ecosystem have change the BME's motivation and drive to find different IC. DWI and the Wind Energy BME have until now not been particularly interested in relating to different BME's. However lately due to business and technology interest there has been more interest. These relations have primarily been establish from a bottom up perspective as different businesses in the BME have tried to relate to different BME's to find valuable IC.

5.3 AH Industries

AH Industries is one business in the Danish Wind Mill BM Ecosystem and delivers products, consultancy services and site management to other Businesses BM's in the Wind Mill BM Ecosystem. One of AH Industries specialities is to machine metal in any size to parts for the Wind Mill businesses as Siemens, Vestas, Suzlon and GE. The Wind Mill businesses Siemens, Vestas e.g.assemble BM's from many suppliers and offers the Windmills to Energy Businesses as DONG, Watenfall e.g. AH Industries are competing other suppliers in the Wind Energy BM Ecosystems and have until lately primarily been focused on value and IC exchange inside this BM Ecosystem. However lately AH Industries began to enter other BM Ecosystems – e.g. Concrete BM Ecosystem, Hydro Power BM Ecosystem. This was done by acquisition of two businesses.

AH's interest to join different BME's was primarily of economic interest and not as such about transferring knowledge and IC. Therefore the different Business Unit have until now operated separately and not related very much. AH control strategically relations between different BME's and tries to have different Business Units and thereby BM'S to stick to their core Business. This often prevent them "to think and relate out of the box".

5.4. MCH (MCH)

MCH is one of Scandinavians largest and most flexible amusement centers with over 900.000 visitors each year. MCH has 4 BM portfolios – The Fair center Herning, MCH Herning Congresscenter, MCH Arena and Jyske Bank BOXEN. MCH has the competence to provide meetings for 15 people, congres for 2.000 participants, football matches and arena for 11.000 spectators and fairs up to 50.000 guests. MCH competence is to provide BM's and BM Eco systems where amusements, business model exchange are core. Amusements can be a broad spectrum - rock, teater, musicals and big sportsevents. MCH host and set up more than 500 arrangements pr. year and is one market leader in setting up BM Ecosystem of amusement. MCH competence are professional and serviceminded employess, topmodern facilities. Unique experience and facilitating people and technology to meet each other is MCH's core competence.

MCH set up every second year a Industri Fair – a BM Ecosystem – for the WindMill Industry and other Industries – other BM Ecosystems. The Industry Fair called HI – Fair – functions as a BM Ecosystem for 5 days. Many business with many different BM's operates in the HI – BM Ecosystem led by MCH. All BM's present at and under the HI – BM Ecosystem negotiates with MCH to be able to offer their BM's in the BM Ecosystem.

Until now MCH have had very limit interest to relate to different BME but due to decline in some of MCH's BME they have decided to opening up e.g. to University BME.

6. Discussion

Ecosystems and BM Ecosystems seems to share much related to characteristics, structure and living. Maybe that is not that strange because BME are built on biological ecosystems – and therefore they are interrelated and share values and competences. However mentally we often regard BM, Business and BM Ecosystems mentally as something different to “a swarm of fish or flies”. Maybe we can learn much about BM Ecosystems via studying biological ecosystems – and maybe we have not paid attention enough to learn from these ecosystems that are related to other outputs than money and profit.

The approach of our research was to use a proposed BM Ecosystem framework to “see” and “sense” challenges and barriers to IC exchange between different business model ecosystems.

In this process the business we “downloaded” information on BME’s “AS IS” and “TO BE” BM’s existing and potential relations to BM’s and thereby IC in other BM Ecosystems. IC and potential relations to IC – which the Business in focus might not in their daily work be able to “see” and “sense” by themselves before mapping in the relation. Relations to IC that in their daily business operations were valuable could now be visible and measured. When all relations for each BM Eco System were mapped – which we found that were extremely time consuming – it showed “To BE” and “AS IS” BM relations to IC, which enabled the business potentially to understand better the challenges and barriers to IC exchange with different BM Ecosystems. Firstly we discovered a large BM Ecosystem – the BM Ecosystem of renewable energy. In this BM ecosystem we discovered sub BM Ecosystems as Wind Energy, Solar, Biogas, Wave energy BM Ecosystems. The BM Ecosystems were mapped to each specific BM Ecosystem relations were observed and registered. However we did not get a full and detail picture of the relations – but we could discover that many relations which could turn out to be valuable relations to BMI were lacking or were not set up. BM Ecosystems within the renewable BM Eco system were mostly concentrating on building up internal relations, running internal relations and exchange of value and IC internal their BM Ecosystem. Lack of meaning, motive, motivation, competition was some of the explanations to why IC from one BM Ecosystem was not released to another. However when the question of fossil versus renewable energy BM ecosystem came up – (Cop - 2009) mentally it was possible to discover that the renewable BME’s mutually could melt together and exchange IC. These observations was registered both for tangible and intangible values and relations. This was registered related to creating, capturing, delivering, receiving and consumption of values send through the relations established between the BM Ecosystems. This means it was now possible to a BM Ecosystem to “see” and “sense” which values and IC really had an impact and contributed to a certain BME and the BM’s inside the BME.

The work is time consuming – as earlier mentioned - and would by preference have been much easier to do if it could have been digitalized – or was digitalized between and inside the BME’s . We argue that most of the information about relations to IC between BME’s are “sleeping” and “unused” relations, which is a major reason to why IC between BM Ecosystems are not released or not released before there is a need for them. As we saw in the MCH BME MCH had many relations but did not activate these before they

were challenges to the survival of some of their BME's. However sometimes this is too late because relations are broken, BM's and BME's have moved away or closed them self for new entrance. The relations to value and IC outside BME's can also quit simple be found and mapped if customers and network partners from BM's in different BM Ecosystems are included or overlapping more BM Ecosystems. As we observed in the Wind Mill BME many of the Businesses were present in more BM Ecosystems, which enabled value and IC exchange between BME's via specific Businesses. As for research purpose we used some supporting tools (Amidon 2008, Alee 2011, Russels 2010) to map the relations, which helped us to overview the value stream and relations between BME's . More research has however to be carried out here to get a better picture as some information are lacking – especially “Seeing” and “sensing” the relations and value flow from outside BME.. However we observed

that different BME's very seldom exchange value and IC – unless they are motivated and forced to do so.

In this case Universities and Governments can play a very central role to support and motivate for more value and IC exchange between different BME's.

Better methods of mapping intangible relations to value, IC and hidden knowledge are however vital to get a better and more relational picture of a BME's relations. Alee's value network tool has again been helpful to use ´when mapping intangible value and relations inside a BME and to some extend between BME's. Russels, Amidon's and Hagedorns (Hagedorn 2005, Amdion 2008, Alee 2011) relations framework and tools are helpful when mapping relations more in a social BME network context and perspective – especially intangible relations to knowledge zones. The 4 interrelated BME use cases each represent different BME's seen in different contexts. They show different relations approaches to “see” and “sense” relations to and between BME's. The “Seeing” and “Sensing” part was only done from the specific BME view point but could have been seen from other viewpoints. The 4 BME casesshowed us that they had very different characteristics related to those challenges we earlier discovered to why IC is not released between BME'. These are comment in table 4.

Table 3. BME relations related to the 4 BME cases

Cases	Characteristics	Quadrant 1 inside the BME	Quadrant 4 outside the BME
The REBME	Multi BME Based Primarily Inside renewable energy BME Based	Many tangible and intangible relations internal to different BME's inside renewable Energy BME Ecosystem.	Several identified potential BME's with unreleased tangible and intangible relations to IC.
The DWI BME	Single BME Based Primarily supporting Inside BME IC concerns	Many tangible and intangible relations internal Wind BME. Many tangible and intangible relations to many competences inside Wind Energy BME.	Few identified tangible and intangible relations to different BME's with potential unreleased IC.
The AH BME	Primarily Single BME based	Few tangible relations internal to different BME's. Many tangible relations to the same competence in BME	Very few identified tangible and intangible relations to different BME's with potential unreleased tangible and intangible IC
The MCH BME	Primarily Single BME based	Many tangible relations internal to different BME's. Many tangible relations to few key competences in BME's	Few identified relations to BME's with potential unreleased tangible and intangible IC

Table 4. Characteristics and relations to IC of different business.

Fundamentals for Value and IC flow can be released	RE	DWI	AH	MCH
Value offered from different BM Ecosystem must give meaning to the other BM Ecosystem.	NO	Yes	Yes	YES
Relations between BM, Business and BM Ecosystems must be established	NO	Limit relations	Limit relations	Limit relation yet
There are competences in one BM Ecosystems BM's that are attractive to another BM Ecosystem	NO	Yes – but still limit interest	Yes – but until now limit interest	Yes – but until now limit interest
One BM Ecosystems wants, need or demand exchange of value and IC from different BM Ecosystem	NO	Very limit interest	Very limit interest	Until know very limit interest but due to decline in BME now opening up
BM Ecosystem control processes enables relations and are willing to enable relation to be established	NO	Not particularly	Not particularly	Until now not particularly but in change
BM Competence are free – not restricted or	Yes	Yes	NO	Yes

prevent to exchange to other BM Ecosystem				
BMI competences are available in different BM Ecosystem	Yes	Yes	Yes	Yes

When one analyze the characteristics and the relations of the 4 BM Ecosystems cases individually it shows that the BME's are quiet introvert – they use relations mostly to IC internal the BME or relation to IC of known and close BME Ecosystems. It seems that there is much unused potential IC to release for both "TO BE" BM and change of "AS IS" BM's when BME's relate and do more interaction with BME's that are different.

The use cases studied point overall to a need of having different BME's focus more on "seeing" and "sensing" each other. BME's have however to "learn" how to relate to different BME's IC and then learn how to release IC strategically through tangible and intangible relations to different BME's. Business that try to release tangible and intangible IC "blindly" from different BME's often miss the real IC relation opportunities and values. They will not be able to "find" IC that they are really looking for and which could create sustainable business model opportunities to their BME's. Further they might not even be able to release IC, which are vital for their BME's because they do not real "see", "sense" and understand the relations to IC and interdependencies to relations of other BME's. Thereby the meaning of releasing value and IC from different BME's get lost.

7. Practical implications

BME's can in the work of mapping relations to IC in different BME's have advantage to use different methods to map relations. We propose that BME's has to work with different methods and hereby "learn" their relations to different IC. Especially 5 areas seem to be important in this work:

1. Use user friendly relations mapping tools for BME's relation mapping.
2. Use different relations mapping methods and tools
3. Use methods and tools which can map actual and potential BM s relations - both for "A'S IS" and "TO BE" BM in different BME's

4. Use BM relations methods and tools that can map value stream and relations over time
5. Use different viewpoints related to mapping relations of BM
6. Use methods and tools that can also show the implementation and operation part of value stream and relations – the "ACT - DO" phase and part of relations of different BME's.

In the process of mapping relations business in different BME's also need in beforehand to be aware of their potential relations and relations that they or more precisely their BM's are not part of – the "IN OUT", "OUT IN" and especially "OUT OUT" relations. Mapping these is a question of "seeing" and "sensing" out of the box. This of course demands resources and time to go deeper inside and outside the business and its business models. In our research we observed more times that business often begin BMI without analyzing carefully enough their BM's relations, relations to IC. Hereby they miss to identify where the business BM's real and hidden relations to IC really are and thereby find those relations to potential IC that can be in many case already be used in their BMI from different BME's.

The Business can when mapping relations to different BME's IC face a real revelations and new self transcending knowledge about relation to IC.

8. Conclusion

BM ecosystem can be defined form very different contexts however the ecological system approach gives much inspiration to how a BM Ecosystem could be defined. The difference is however that ecological systems are mostly related to physical system approach whereas BM Ecosystem also are related to mental approach – which BME do my business belong to.

This paper shows different BME's relations to IC and challenge to relate to IC in different BME's. Hereby it is possible to "see" and "sense" from a specific BME viewpoint the operating BME's business BM's tangible and intangible relations to IC inside and outside the BME's. The BME cases were firstly mapped with their relations to different BME's by "downloading" their tangible and intangible relations of BME's. We map them and found 2 relations context

1. *“IN IN” relations* - focusing on the relations of BME’s - its relations to other BME’s inside the BME. The view point was seen from the single BME’s side inside the BME.

2. *“OUT OUT” relations* focusing on relations to different BME’s outside the BME. The view point was seen from the single BME’s side outside the BME.

BME’s have stronger “IN IN” relations than “OUT OUT” relations which is not surprising. However it seems as if when BME’s and Businesses inside BME’s begin to mentally feel pressure on survival then they begin to be more open to relations to different BME’s. Therefore the meaning of relating to different BME’s IC play a very important role to why BME’s relate or do not relate to different BME’s.

The important barriers to release more IC between BM eco systems are meaning, control, and need. Meaning and need seems to be fundamental to have BME’s to relate – where control can be a serious prevention to open up relations to different BME’s. Fundamentally relations have to be established to release IC.

Business can release more IC between BM Eco systems but there has to be a meaning. When society and governments together with strong BME’s continues to control and support single BME evolvement then they seems to prevent more release of IC.

9. Further Research

Mapping relations inside and outside BME’s is today very complicated and time consuming to carry out. There are today few tools that support BME IC relations mapping. Value network relations tools “tell” the business about value streams – both “tangible” and “intangible” and Social network relations tools “tell” about which Business from which BME is related to which BME. When put into the BME relationship axiom the value stream or potential value stream transfer between BME’s becomes visible. However the tools still only shows a fragmented picture of the value stream and not if really if IC transfer is really carried out and further potential value transfer.

New methods and more research to better encompass how BME’s can release more IC and hidden knowledge is highly needed. Especially we believe that more digitalization of business relations inside and outside BME’s will give a better understanding about what relations and relations to IC in different BME’s really exists – and How to release more IC from different BME’s. The digitalization of the BM will also give possibilities for BMI leaders to apply and see different BMI scenarios and effects of their BMIL strategies

related to releasing IC from different BME's. This work we have just commenced to carry out.

Appendix 1 The Multi Business Model Approach

The Multi Business Model Approach was proposed by Lindgren et All in 2012(Lindgren 2012) as a matter of definition that any business must be considered as having more than one business models.

Structured Abstract

Purpose - The idea of business model innovation and releasing of IC gets into problems if the theoretical works of Veblen acts as corner-stone in order to understand BM Eco-systems. IC - per definition - meets a systemic framework where the normative idea of meaning becomes part of the theoretical and practical discussion. We have mish-match between what the economy is able to produce compared with what the economy in practice produce. We have a cavalry of actors (IC) with specific intentional acting. Taken together the interplay between these elements create specific conditions for the context dependant term “sustainability” (McNeill, 2000).

Design/methodology/approach - The paper provides a theoretical study of the Veblenian framework conditions to BMI, ecosystems and the requirements to sustainably BM from a Veblenian perspective. The empiric research methodology is primarily an action research approach. Mapping our findings with reference to Veblen and a BM ecosystem perspective we get a new picture of BM-Ecosystems relations to IC? Methodologically the idea of national innovation systems (Lundwall 1992, 2010), eco-system (Heikkilä & Kuivaniemi (2012), BMI processes and empiric illustrations are linked to Veblen . This illustrates how releasing of IC depends upon economic organization combined with the general rules of the game.

Originality/value - The research reveals that BMI with absentee ownership prevents release of radical BMI IC. Because of the rules of the game these businesses per definition don't have the incentive. Businesses are at management level hereby not able to create, capture, deliver, receive and consume the real potential of different business model ecosystems. The only way to secure sustainability is the creation of a fundamental change – a transformation. Point of departure must be defined as the institution Politics or pressure from the outside (Horn Rasmussen 2008 inspired by Veblen 1914, 1923a).

Practical implications Businesses struggle continuously with releasing valuable IC. This challenge exists because of the economic organization and the inherent conservative institutions including the institution of “Make-believe”. The absence of important potential IC to develop their business introduces a need for a discussion of new strategies at both a micro- and macroeconomic level to improve and increase the release of IC to BMI. Business should be more structured about their mapping and releasing methods to IC inside and outside their business, focus on the different roles of actors and the general framework conditions for releasing IC in the economic system.

Keywords: Intellectual Capital, Veblen Grand Theory, Institutional and evolutionary economics, BM Eco systems, Actors

Paper type – Academic Research Paper

1 Introduction

From a system – or macro - point of view - the idea of business model innovation and the releasing of IC gets into a huge dilemma if the theoretical works of Thorstein Veblen acts as one of the corner-stones in order to understand Business Model Eco-systems. IC - per definition - meets a systemic framework where the normative idea of meaning, meaninglessness and rationality becomes part of the theoretical and practical discussion with reference to at least three themes. First of all we have what Veblen announces as “The State of Industrial Art”. It refers to the mish-match between what the economy is able to produce compared with what the economy in practice produce. Secondly, and this is the main focus in this paper, the theoretical work of Veblen operates with a cavalry of actors. Each actor have - what we from a Veblenian perspective can call it – intellectual capital, which – per definition - is bound up into a specific intentional acting defined at a general level. Thirdly, those two elements represent two different aspects – or framework conditions - of how intellectual capital is released in any practical Business Model Innovation process. Taken together we claim that the interplay between these two elements create an overall general framework for a discussion of the context dependant

term “sustainability” (McNeill, 2000). Being more precisely, multi business model innovation and releasing intellectual capital (IC) from a business BM’s through the business model innovation process rest upon – at least – two different framework conditions where the dominating model (The Veblenian Modern System 2 interpreted by Horn Rasmussen 2008) act as the superior because it defines “The Overall and General Rules of the Game”. For an illustration of what Multi Business Innovation is about see appendix I.

Because the Veblenian approach is primarily theoretical there is a need for qualified definition of the empirical object. Our contribution to this task and the methodological reflection has an initial reference to the idea of BM Ecosystems (BMI) and Intellectual Capital (IC). However, the relationship between the two notions has not had substantial attention by academics and practitioners. Consequently, the contribution from the paper is explorative.

There is until now also no accepted language for BM Ecosystems that would allow researchers who examine different BM’s relations and the potential to release BM’s IC between different BM Ecosystem. The paper attempt to contribute by proposing how the link between BM, Business Model Components, Business Model portfolio, the business and the different ecosystems represent the potential for a BMI process, which together with some general rules of the game, as defined by Veblen, lay down the framework conditions for a business’ BMI process.

Based upon – primarily – our action research we discuss how the theory presented is reflected in selected and concrete BMI processes.

2. The idea of ontology in the paper

The methodological reflection has reference to ontology¹ and the idea of explanation. The most influential theoreticians are Roy Bhaskar and Tony Lawson (Lawson 1997: ; Lawson 2003a: ; Lawson 2003b) and Jon Elster (Elster 1983: ; Elster 1986: ; Elster 1989). The reflections of Lawson, based upon the thoughts developed by Bhaskar, belong to critical realism. They aspire to develop a universal ontology of economics. On the one

¹ “By ontology I mean the study (or theory) of being or existence, a concern with the nature and structure of the “stuff” of reality. Now, all methods have ontological presuppositions or preconditions, that is conditions under which their usage is appropriate” (Lawson 2003b:12)

hand, this ambition can be postulated to represent an alternative means of thinking as compared with Elster and the discussion in which the potential of multiple explanations is offered². On the other hand, Lawson and Bhaskar argue for the existence of an ontological hierarchy of explanations within economics. Their method is to seek behind the cause to the cause of the cause etc. This implies a position of endless regress. We can never be absolutely certain that we have found the truth. This also indicates a kind of openness to multiple explanations. One methodological challenge in the research process is to test the usefulness of an Elster/Lawson combination. Elster's idea is to go from macro to micro, i.e. reductionism. He focuses on explanation by mechanisms.

To explain is to provide a mechanism, to open up the black box and show how the nuts and bolts, the cogs and wheels of the internal machinery (Here the term "mechanism" should be understood broadly, to cover intentional chains from a goal to an action as well as causal chains from an event to its effects) (Elster, 1983: 24).

Our task is broader, because we are inspired by the term "transformation". Transformation is a result of a radical change in at least one of the central rules of the game (Horn Rasmussen, 2008). A demarcation to a focus on mechanisms would make the term "mechanisms" identical with the term "rules of the game". This is not our initial intention. While Elster's universe is the micro-foundation of the economy and a general neglect of anything other than the micro-universe, the philosophy of Tony Lawson as based upon Bhaskar points in the direction of the meta-universe. Methodologically, the combination between Elster and his priority on causal and intentional explanations within social science, and the search for an universal meta ontology as inspired by Lawson is on the one hand contra-dictionary. On the other hand, the methodological idea is that such a combination may involve more theoretical insights. This may contribute with a heuristic element to the research process. The latter argument supports the attempt to make such methodological combination.

This leads us to a position where a construction a kind of patchwork of explanations may contribute insight to our research question. However, as we are going to demonstrate much of the patchwork construction may very well refer to the theoretical perspective. What level of abstraction does the arguments belong to? The task may be implemented as

² In Elster (1983) the idea of explanations (causal, functional and intentional explanations) is confronted with theories of technical change (neoclassical theories, Schumpeter's theory, evolutionary theories and marxist theories).

adequately as possibly. As one might already notice, this brings us to the first consequence of our study; when we conclude, we have merely made a contribution to a new beginning based upon a deeper understanding of solving our problem. This is the position of the critical realism approach, which by definition always will argue in such a manner. Besides, there is a link to Lakatos and his methodological approach for a continuously search for and establishment of new research programmes. By now, the link between explanations and understanding should be indicated. Understanding represents the deepest archive of knowledge. Explanations are the means, while understanding is the aim. The general issue in this methodological reflection concerning what could be perceived as “A contribution to a concept of explanations in order to reach a better understanding.” The task is not to neglect a search for a model, but rather, the ambition *to create an initial foundation for a model during the compilation of different theories*. This forwards a crucial question; how do we select our theoreticians, what are the arguments and what is our delimitation? In this paper we have chosen to focus on Thorstein Veblen because he argues for certain systemic limitation for any BMI process. We find it useful to investigate if the Veblenian perspective offers important insights in order to understand the question of releasing IC in the process of BMI? In order to investigate the question we find that point of departure could be understanding of the object for BMI. Within a macro level the idea of National System of Innovation has for a long academic period contributed to define the foundation of the knowledge economy. However, recently the idea of eco-systems has been much debated both within the academic and industrial communities. Based upon this compilation we are going to present a contribution to how to create a link between a macro and a micro perspective with an explicit reference to business model innovation (BMI).

3 Research question

For managers of business our research indicates that the unawareness of different BM ecosystems in relation to the focal Business Model Ecosystem seems to inherent revelatory information and unreleased IC related to BMI. The basic for a business is firstly to know and define their own “AS – IS BM ECO Systems”. Next step could be to know and define relations to other BM ECO systems and then start “seeing” and “sensing” potential BM relations to different BM ecosystems. This address at least two questions. How is their Business Model Eco system related to IC and how is their IC

released? And further: How can business release IC through BM relations to other BM Ecosystems? In the meantime and simultaneously for giving a precise answer to these questions we find it important to step up and give an answer to a more general question:

How does IC release in the economic system?

The idea is that a combination of different explanations and understandings – within different levels of abstraction - will increase our general archive of knowledge and consequently contribute to improve the theoretical knowledge in the academic communities with reference to innovation processes. Besides, such potential for increasing the existing knowledge might be of practical importance for the concrete IC work within the businesses at a micro economic level.

4 Veblen and his contribution to understand Business Models, Business Model Innovation, Eco-Systems and IC

4.1 Introduction to the relevant elements in The General Theory of Veblen

It is our hypothesis that The General Theory of Veblen as outlined by Horn Rasmussen (2008) may contribute to the understanding of Business Models, Business Model Innovation, Eco-Systems and IC. The theoretical work of Veblen is complex. However, in this section we focus on seven elements of The General Theory and investigate how they can be linked to both the theoretical and empirical work related to BM, BMI, Eco-Systems and IC.

The elements are:

1. The Mechanism: The Interstitial Adjustment of the Industrial System
2. The Mechanism: All politics are business – Politics one
3. The Institution: Make Believe
4. The Institution: State of Industrial Art
5. The Institution: Politics two
6. Evolution of the Actor Cavalry
7. Evolution from handicraft to modern system 1 and 2

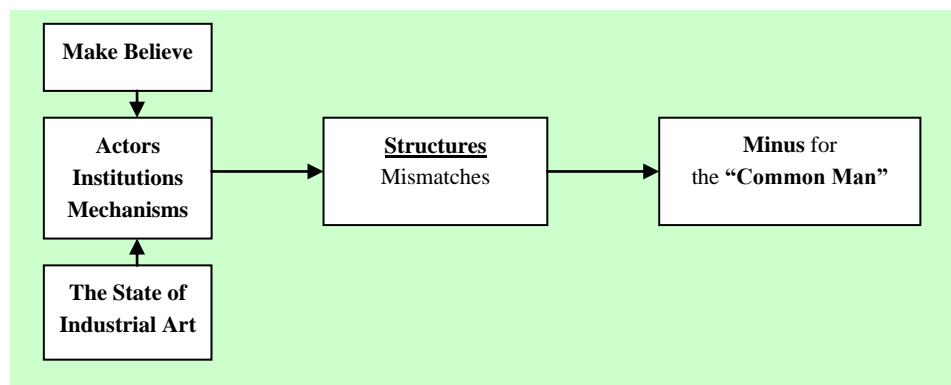

Taken together we are going to demonstrate how these elements from The General Theory of Veblen contribute to create a new understanding of the framework conditions for BMs, BMI, Eco-Systems and releasing of IC in the economic process at a general

level. However, our research indicates that even we are talking about theoretical “innovation performance” at a general level, the theoretical elements can be illustrated from our concrete work with businesses and their BMI-processes.

We present the above elements step by step after a brief discussion of two definitions and after that a longer – but necessary - presentation of the overall idea of how the economic system has changed and created other framework conditions for BMI than normally taken for given. First we must touch upon the necessity of discussing the idea of mechanism. How are the relationship between a mechanism and an institution? In Veblen, principles are an institution, not a mechanism, because principles are context-dependant. Mechanisms are closer to the idea of a universal and the continuous existence of “something” working underneath the institutions and elements in the institutions that define the content of the institution. The definition of an institution is “An institution is of the nature of a usage which has become axiomatic and indispensable by habituation and general acceptance” (Veblen 1923a: 101 note 1). Second, we now go into a description of the Veblenian approach for evolution during his analysis of the shift from handicraft to capitalism in order to present some important framework condition for BMI.

4.3. Veblen’s model of structural change – the foundation of the theory

According to Veblen the scientific task is a matter of understanding a delicately balanced complex of sub-processes. Based upon his works Horn Rasmussen (2008) has constructed the model, or rather “His Interpretation of the Economic Theory”. First, he scrutinises the general model of Veblen:

Source: Horn Rasmussen (2008)

Figure 3.1: The General OHR-Veblen Model of Structural Change – part one

The interaction between actors and institutions based upon some fundamental mechanisms leads to a number of specific structures. These structures reflect a complex system of mismatches. The mismatches are the results of the economic process. These results are negative for what Veblen terms “common man”³. However, it is two other kinds of mismatches, which is part of the reasons for the creation of the mismatches. Within our context, it is appropriate to refer to the two mismatches as two rules of the game (It is important to notice the double character of the term “mismatch”; as a result of the economic process and as a rule behind the economic process). The most fundamental mismatch is that the net product of society is lower than its social potential. Veblen defines social potential in terms of the concept⁴: “The State of the Industrial Art”. The State of the Industrial Art is a dynamic concept. The general reason for the mismatch in the institution “The State of the Industrial Art” is another mismatch; Veblen claims that there is a mismatch between the dominating habits and the need for new habits. We are talking directly about a conflict between the existing “rules of the game” and the need for new such rules. The dominating habits constitute an institution and consequently a dynamic concept. Horn Rasmussen (2008) names this institution “Make Believe”. In order to understand the two discrepancies and their relation to the dynamic process of industrial structural change, he argues that Veblen operates with:

1. Three universal capitalist mechanisms
2. Five institutions and two sub-institutions
3. Two general and six specific mismatches in structures as a result of capitalist evolution

The mechanisms are:

1. Interstitial adjustment
2. The market and the price system
3. All politics are business – politics I

³ “...he is called common because such is the common lot of men under the new order of business and industry; and such will continue (increasingly) to be the common lot so long as the enlightened principles of secure ownership and self-help handed down from the eighteenth century continue to rule human affairs by help of the new order of industry” (Veblen 1919: 131). We delve deeper into the idea of the common man in the section dealing with “Politics”.

⁴ In the outlining of Veblenian economics, Horn Rasmussen primarily use the term “concept” as the general point of reference instead of e.g. the term “idea”. The term “concept” may refer to something more firm than “idea”. However, it is rather difficult to distinguish between the two terms, as a concept can be argued to be an idea and an idea can be argued to be a concept.

The institutions are:

1. The institution “Make-Believe” and its sub-institutions “Vested Rights of Ownership” and “Money and Profits”
2. The institution “State of Industrial Art”
3. The institution “Competitive System”
4. The institution “Credit and Business Capital”
5. The institution “Politics II”

The mismatches are:

1. Mismatch between potential and actual social net products – The institution “State of Industrial Art”
2. Mismatch between dominating habits and the social need for new habits – The institution “Make-Believe”
 - 1.1 Mismatch between owners and non-owners
 - 1.2 Mismatch between large owners and small owners
 - 1.3 Mismatch between businessmen and the corporation and its absentee owners
 - 1.4 Mismatch between businessmen and industrial intellectuals
 - 1.5 Mismatch between community, businessmen and corporations
 - 1.6 Mismatch between the vested interest of the common man and the vested interest of absentee owners, businessmen and industry.

The actors, or as Horn Rasmussen pronounces it “The Cavalry”, the mechanisms, the institutions and the mismatches constitute the general theory.

Next part of the “OHR-Veblen model” has the first focus on the dynamic character of the above model. Structural change is characterised as an adaptive, evolutionary and conservative process. Horn Rasmussen claims that this is the Veblenian definition of structural change or, in the terms of Veblen: “Structural development”. Veblen assumes that the life of mankind – like other species – is a process of selective adoption. This inspiration is close in line with the concept of Darwin. Life is a struggle for survival. Societal change is a matter of the change of institutions as “a process of natural selection of fittest habits of thought” (Veblen 1899: 101). Veblen argues:

The forces which have shaped the development of human life and of social structure are no doubt ultimately reducible to term of living tissue and material environment ... may best be stated in terms of an

environment, partly human, partly non-human, and a human subject with a more or less definite physical and intellectual constitution (Veblen 1899: 101).

The development process is based on the past habits in these institutions. Veblen is even more precise.

A generic inquiry into institutions will address itself to the growth of habits and conventions, as conditioned by the material environment and by the innate and persistent propensities of human nature; and for these propensities as they take effect in the give and take of cultural growth, no better designation than the time-worn "instinct" is available (Veblen 1914 (1964): 2).

The distinctive feature by the mark of which any given instinct is identified is to be found in the particular character of the purpose to which it drives. 'Instinct', as contra-distinguished from tropismatic action, involve consciousness and adaptation to an end aimed at (Veblen 1914 (1964): 4).

This means that *all of the actions of mankind are teleological*. Accepting this argument raises the question about the general theory of Veblen as a fundamentally *intentional theory*?

The fact that the habits of the past are part of "the rules of the game" in the present produces an inherent and potential unbalance between the needs of the present and what the present is actually supported by. Horn Rasmussen (2008) underpins this as a first example to what could be termed; *a concept of mismatch*.

Contrary to mainstream or neoclassical economists Veblen is a fundamentally a disequilibrium theoreticians. Veblen introduces the concept of "The Interstitial Adjustments of the Industrial System". Horn Rasmussen (2008) interprets it as a fundamental mechanism in the theory of Veblen. *Interstitial adjustment characterises the inherent mechanism of the aims of different groups of businessmen to create or hinder the instability of the industrial system*⁵. The point of departure is the inherent contradiction

⁵ *The concepts of "sabotage" and "waste" is not part of the elements we have chosen to this paper. However, the concepts play a major role in the process of interstitial adjustment. The "interstitial adjustment" mechanism is present at any time, as are "sabotage" and "waste". However, dealing with these concepts has been chosen to be part of the "Institution Competitive System". We could have categorised both concepts as part of the "interstitial adjustment" mechanism, but we find that "sabotage" and "waste" contain so many dynamic- and context-dependent elements that we would lose some of the dynamics pointed out by Veblen in doing so.*

between the interest of the community as a whole and the businessmen. “Instability” is of great importance to certain groups of businessmen because of the possibility to realise large gains. “The end is pecuniary gain, the mean is disturbances of the industrial system” (Veblen 1904: 16)⁶. Especially the new and rising class of pecuniary experts “whose business is strategic management of the interstitial relations of the system” (Veblen 1904: 17) is claimed to have interest in large disturbances. This class is “the captains”, and their operations must be understood with reference to obtaining control over some large portion of the industrial system. When the control is obtained, the interest of the captains is to maintain business conditions as they are and to further facilitate the support of the position. The position of the businessmen shifts from an interest in instability to a wish for continuity. Anything in their interest relates to the ability to obtain gains. Their aim is pecuniary optimising. The method is to use transactions and make deals (“the business jargon borrowed from gaming slang” (Veblen 1904: 18)).

This focus on a capitalist theory of instability, non-equilibrium and mismatch contributes to making the universe of Veblenian Economics available to any analysis of structural change. Veblen expresses this in the following manner: “In the nature of the case, this process of selective adaptation can never catch up with the progressively changing situation in which the community finds itself at any given time” (Veblen 1899: 102). The evolution proceeds, stage after stage, with the institutional element as a conservative factor. In order to illustrate Veblen’s perspective clearly, his focus is to consider the character of the process of structural change. His economics have never addressed the technical complexities within the industry, e.g. the complex technological knowledge constituting the material foundation of industry. A central dimension in the Veblenian universe is the existence of resistance to change; as a general rule, there is an inherent resistance to change. This conservatism is the source of a theoretical assumption and the idea of the inner relations in the institutions versus the “outer relations”. Change occurs because of external pressure. The interpretation of Horn Rasmussen (2008) of the Veblenian approach to the concept of change at this point refers to a “*Radical Change*” and the introduction of a new steering system. Without being explicit about the term “transformation”, Veblen makes considerations concerning our concept of transformation. However important this may be, Veblen does not follow the assumption about “outer

⁶ *In order to understand the mechanism, it must be noted that Veblen does not include the so-called “old-fashioned businessmen” in this group of businessmen. The old-fashioned businessmen are those using “the old-fashioned method of permanent investment in some one industrial or commercial plan” (Veblen 1904: 16).*

relations” in a systematic manner. In one of his latest works and under the influence of the Russian revolution, he touches the subject with reference to a subgroup of the workers – the engineers – and discusses their potential in America to become the leaders of a fundamental change in the economic organisation. It is worth noting the striking link to Hvelplund’s concept that change demands the existence of a strong alternative to the existing set-up or practice (Hvelplund 2005).

4.4 The dynamic of capitalism and the altered conditions for BMI

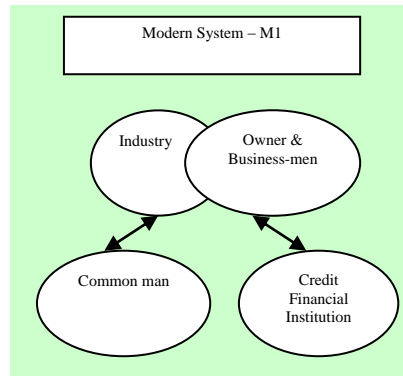

Next step is focus on long-term structural change and transformation. Veblen uses the term “Modern System” in order to understand the real functions in the capitalist system. He is not very precise about “Modern system”. According to Horn Rasmussen (2008) the central reasons may be because, according to his interpretation, there are in fact two modern systems in Veblen’s universe - termed M1 and M2 by Horn Rasmussen (2008). The first modern system replaces “The era of handicraft” and is introduced as a function of the industrial revolution. The time and space is identified as the latter quarter of the 18th century in Britain. However, the evolution of capitalism is a cumulative process. It becomes increasingly complex, and the first modern system is gradually replaced with Modern System II, fully implemented around the last quarter of the 19th century⁷. From then on, absentee ownership and the separation of ownership and management in distinct categories together with a widening of the financial sector *fundamentally changed the rules of the game in capitalism*. Within the context of Horn Rasmussen (2008); Transformation results. The evolutionary process of these changes, which has been implemented over a period of 150 years, is a fundamental pillar in Veblen’s theoretical apparatus. Summing up:

1. First phase – the era of handicrafts and trade – HT
2. Second phase – the first era of modern capitalism – M1
3. Third phase – the second era of capitalism – M2

According to Veblen, Adam Smith’s theoretical considerations caused the creation of an element in what Horn Rasmussen (2008) choses to term “The Institution of Make-believe”. “He [Adam Smith] writes ... of the machine era, but he speaks in terms of the past industrial era” (Veblen 1914 (1964): 237). Horn Rasmussen (2008) at this point

⁷ *The introduction of and shift from Modern System I to Modern System II varies from country to country in the western capitalistic world. The important point is not the exact historic time but the introduction and implementation of the systems all over and with a minor time-lag from country to country.*

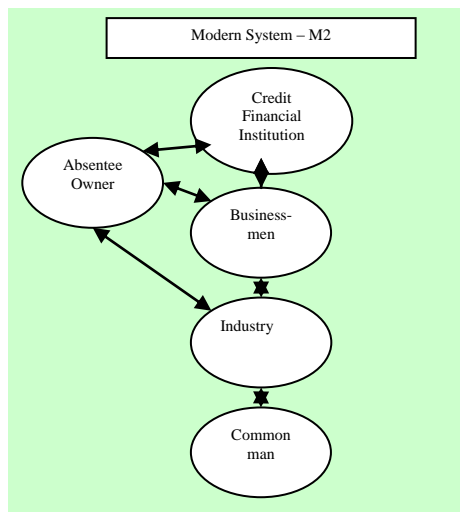

stresses, that Veblen reflects on the cumulative nature of capitalism. His interest is primarily bound up to the difference between M1 and M2 and the links between the common man, industry, management, credit and ownership in M1 and M2 can be illustrated graphically.

Horn Rasmussen (2008)

Figure 3.2: The OHR-Veblen model for structural change - part two M1

Veblen's point is that the function of the modern system has changed, but the institution of make-believe remains unchanged. This means that the society rests on an old-fashioned institutional foundation. The complex modern system can be illustrated graphically:

Horn Rasmussen (2008)

Figure 3.3: The OHR-Veblen Model for structural change - part three M2

In order to understand the content and fundamental difference between HT, M1 and M2, actors must be introduced and the shifts in their respective roles and their interests in the process of structural change must be outlined. The actors at the micro-level of the economy are categorised in groups of people with the same general interest, motives or reasons⁸. The point of departure is the workers, owners of industry and landlords. This reflects a similarity to the classical production function and the existence of wages, profit and rent. Veblen's task is to analyse the dynamic development of the ideas of actors in all the three phases. This ends up in a complex system which Horn Rasmussen (2008) refers to as the "actor cavalry". The cavalry is first fully developed in the third phase: M2. The organization of society in different groups of people has a further reference in Veblen. The different job positions create different institutions playing different roles in the rules of the game named capitalism.

The general point of departure is that the three coordinating factors of production: land, labour and capital is a holdover from the 18th century. In the Veblenian universe, modern capitalism has evolved into a more complex apparatus. He makes a separation of industry and business. In industry, the production of goods and services is the ultimate goal. The only goal in business is money⁹, i.e. the financial end. Consequently, the Veblenian dichotomy consists of two kinds of work: industrial work and pecuniary work. Industrial work is served by labour, while pecuniary work is served by businessmen. This dichotomy was a result of the technological evolution that was the source of further specialisation.

Presently, as the technological situation gradually changed its character through extensions and specialisation in appliances and processes –

⁸ It can be argued whether these three different "words" are identical. Horn Rasmussen (2008) initial claim is that they are different words with the same meaning in Veblen's universe. When the motive for accumulation initiated by businessmen is money, this is their interest within accumulation, their motive for doing what they are doing, as well as their reason for doing so. When the interest of the worker is to acquire goods and services, their motive to work is obtain goods and services; this is why they do what they do. Behind these arguments is the general need to survive.

⁹ Veblen attacks the concept of money and profits as a neutral concept reflecting a firm universal mechanism. This is the reason why Horn Rasmussen (2008) designates "Money" as an institution. Because of the inherent element of "Make-Believe" it is sub-institution to his institution one. In Veblen's theory, money is an institution due to their inherently dynamic character. Money values play a significant role in any arrangements, and there is an implicit concept that monetary values do not vary. However, history has revealed that the value of money has varied. "But in the routine of business throughout the nineteenth century the assumed stability of the money unit has served as an axiomatic principle" (Veblen 1904:45). The importance of this comment relates to the fact that business is about gains and losses. This makes accounting necessary. Accounting requires a measure, and this is the monetary unit. Having made the final transaction, the outcome for the businessmen becomes the value of the money. This is their ownership and, consequently, ownership "runs in terms of money" (Veblen 1904:45). Money is treated as a practical means of payment – a mechanism in Smith's universe, whereas it is an institution in the Veblenian universe.

perhaps especially through changes in the means of communication and in the density of population – the handicraft system with its petty trade outgrew itself and broke down in a new phase of the pecuniary culture. The increasingly wide differentiation between workmanship and salesmanship grew into a “division of labour” between industry and business (Veblen 1914 (1964): 213).

The result was the creation of two parallel systems living side by side: the business community and the industrial community.¹⁰ In addition to these groups, the landowners play a special role. Landowners may consist of a combination of labourer and businessmen. On the other hand, the landowners can be pure businessmen or pure industrial workers. The businessmen are divided in different groups, where the industrial managers or businessmen are compared with real estate people acting as middle men between the increased number of financiers and absentee owners. This represents the dynamics involved in the shift from phase M1 and M2. Absentee ownership becomes the dominating form for economic organisation, and the role of the financial businessmen is to accelerate the credits. The absentee ownership illustrates the distance between ownership and the daily management, which is led by the business managers. The absentee ownership is conservative and wishes to maintain the status quo. The role of the manager is steered by the responsibility to make as much money as possible for the owners. Part of this money is directed towards the financial sector due to the increased credits from this sector to industry. The workers are divided in two groups: those with technological knowledge, on the one side, while on the other side are the rest of the workers who are productive in running and developing the industry. Those with technological knowledge are further divided in two archetypes: “The Old Technicians”, who do not seek to change the steering system, and “The Young Technicians”, who see a potential for changing the steering system due to the enormous lack of employment of the technology and the enormous waste produced by the system. Horn Rasmussen points out this as an illustration for the intention of Veblen in order to search for sources of transformation. The workers are regarded as the uninformed who pay the price due to higher prices, taxes etc. The special position of the landlord as a potential worker – or the

¹⁰ *There is a striking parallel to Chayanov (1924, 1925 – from Shanin 1986) and his theory of the co-existence of different agricultural systems.*

common man – must be stressed. The general public administration, newspapers etc. are perceived as a means of getting the system to work and keeping change off of the agenda.

Another way of drawing a perspective on the cavalry rests on the assumption that there is a hierarchy of types of jobs. Veblen defines four levels of reputability in which access to property determines the position in the ranking (Veblen 1899: 124):

1. Large-scale ownership
2. The professions which are subservient to ownership and financing, e.g. banking and the law
3. Jobs with mercantile pursuits, unless they involve a large element of ownership and a small element of utility
4. Manual labour

Within this cavalry and the habitual hierarchy within the cavalry, the dynamics and evolution of the modern system from HT to M1 – and further again to M2 – are set to debate. The theory becomes a general theory of the modern system and an inquiry for the need for a new steering apparatus or “new rules of the game”. This search reflects the implicit Veblenian solidarity with “the common man” and his wish to make up with the unemployment of plant, resources and human labour.

3.5 The state of industrial art defined as an abstract global eco-system and the general framework condition for releasing IC in the BMI process

Turning the attention to IC and BMI this position represents a central framework condition where the macro perspective is transformed into the practical framework conditions at a business or a micro economic level. The ability to release IC in the BMI process rests upon some general conditions which are defined by Veblen as “The State of Industrial Art”. The state of industrial art is the institution that science and technology are able to produce more goods and services than are actually implemented in society. This indicates the immaterial dimension of the institution. On the other hand, the technology and knowledge actually exists, which indicates the material dimension of the institution. It is a matter of *the rate of exploitation of the technology and knowledge*. By this consideration, the existence of an inherent mismatch between “actual and potential use of the industrial state of art” is established. Veblen’s intention is to demonstrate an inherent opposition between businessmen, on the one side, and “the outcome of the work of those men who are engaged in the industrial employment”, on the other side. The latter

consists of the “inventors, engineers, experts, or whatever name be applied to the comprehensive class that does the intellectual work involved in the modern machine industry” (Veblen 1904: 19-20). We must recall that their position in the cavalry is as workers or the common man. However, these wage-earning intellectuals pave the way for the businessmen. Taken together we suggest that at a global and general level of abstraction “The State of Industrial Art” can be compared with the overall object for BMI – The Global Eco-system”. As a matter of definition: Within a Veblenian perspective “The eco-system represents a potential which is unused”. This interpretation of the economic macro-system is straight in line with the framework we argue is reality within a business model perspective (Lindgren and Horn Rasmussen, 2013, 2014). Consequently, our theoretical and empirical perspective and the Veblenian approach reach the same framework conditions – however from two different viewpoints.

4.6 Veblen, innovation and the dynamic change the framework conditions for IC and BMI

Proceeding further with Veblen and his treatment of innovation, he states that modern technology has roots in workmanship. “The live-stock expert is soberly learning by trial and error what to attempt and how to go about it in his breeding experiments, and he deals as callously as any mechanical engineer with the chemistry of stock foods and the use and abuse of ferments, germs and enzymes” (Veblen 1914 (1964): 198). While this was the typical situation in the HT-era, technological development in the modern era, starting in M1 and further intensified in M2, used science to accelerate the technological opportunities. An effect of the machine process was further demand for education and increased knowledge. This has been a cumulative process.

And here and now, as always and everywhere, invention is the mother of necessity ... Any such innovation that fits workably ... will presently make its way into general and imperative use ... Any technological advantage gained by one competitor forthwith becomes a necessity to all the rest, on pain of defeat (Veblen 1914 (1964): 314-315).

This is Veblen’s position with respect to innovation, technological advance and the competitive system and Horn Rasmussen (2008) remarks that Veblen was ahead the idea about “the treadmill and cannibalism” official outlined by Cochrane in 1958 with theoretical reference to Schumpeter. The special position of the close relations between

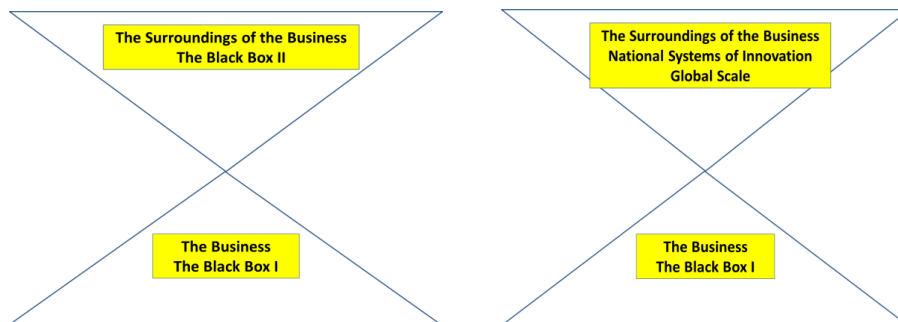

technology and science is crucial. “At no earlier period has the correlation between science and technology been so close ... the relation between current technology and the science is a relation of mutual give and take” (Veblen 1914 (1964): 322-323).

4.7 The idea of Eco-systems as the object for BMI processes – a contribution to the empiric object of Veblen

While the Veblenian approach and connection to IC is characterized as a macro-approach at a high level of abstraction, we need to discuss how this approach can be linked to a more concrete macro and micro object. We find that the idea of eco-systems may contribute to a further understanding of the object for BMI and consequently the question about the framework conditions for releasing IC.

How do we get closer to a more methodological operational approach where theory including the theory of Veblen can be absorbed into the analysis, explanation and understanding of BMI of today? Many researchers have studied the implicit or explicit assumptions about eco systems and business models (Magretta 2002, Afuah 2003, Morris 2003, Osterwalder 2004, Chesbrough 2006, Lindgren 2010, Taran 2013, Zott 2010, Teece 2012, Markides 2013). Eco systems are considered as measurable, objective, and though there are many different definitions and types of Eco systems (e.g., open and closed ecosystems there is still not any acknowledge classification of BM Eco Systems.

In order to qualify the discussion we – as an exercise - go back to “a kind of zero”. It is uncontroversial to claim that a business can be defined as part of its surroundings. However, as a matter of fact much of the ideas about innovation and how innovation activity is suited best could start with the idea of understanding a national system of innovation (e.g. Freeman, Lundvall and Nelson). Because, on a global scale, it is also uncontroversial to argue that in such case the surroundings or “The Black Box II” can be defined as the sum of nations, states etc. or in general the surroundings can be defined as the surroundings defined at a global scale. With our focus on innovation we illustrate the perspective with reference to national systems of innovation. We illustrate this statement in the figure beneath.

We must discuss the idea of this illustration.

First, this is controversial. Can we include e.g. customers, network partners and competitors to a certain business – which obviously must be defined as an important part to a business – as being an automatically part of a certain national system of innovation?

According to Wikipedia “National System of Innovation can be defined as the flow of technology and information among people, enterprises and institutions which is key to the innovative process on the national level. According to innovation system theory, innovation and technology development are results of a complex set of relationships among actors in the system, which includes enterprises, universities and government research institutes. The Term originated when Christopher Freeman and Bengt-Åke Lundvall worked together in the late 1980s. Freeman's research drew heavily on political economy of Friedrich List and historical account of the rise of Japan as an economic superpower. Lundvall's work explored the important social interactions between suppliers and customers and their role in encouraging innovation in Denmark. Apart from a general definition, as above, there is no canonical definition of national innovation systems. A few dominant definitions are listed below (quoted by the OECD publication national Innovation Systems 1997) which overlap quite a bit:

A national system of innovation has e.g. been defined as follows:

- .. *the network of institutions in the public and private sectors whose activities and interactions initiate, import, modify and diffuse new technologies.* Freeman, C. (1995), “The National System of Innovation in Historical Perspective”, Cambridge Journal of Economics, No. 19, pp. 5–24
- .. *the elements and relationships which interact in the production, diffusion and use of new, and economically useful, knowledge ... and are either located within or rooted inside the borders of a nation state.* Lundvall, B-Å. (ed.) (1992).

National Innovation Systems: Towards a Theory of Innovation and Interactive Learning, Pinter, London.

- ... *a set of institutions whose interactions determine the innovative performance ... of national firms.* Nelson, R. (ed.) (1993), National Innovation Systems. A Comparative Analysis, Oxford University Press, New York/Oxford.
- .. *the national institutions, their incentive structures and their competencies, that determine the rate and direction of technological learning (or the volume and composition of change generating activities) in a country.* Patel, P. and K. Pavitt (1994), “The Nature and Economic Importance of National Innovation Systems”, STI Review, No. 14, OECD, Paris.
- .. *that set of distinct institutions which jointly and individually contribute to the development and diffusion of new technologies and which provides the framework within which governments form and implement policies to influence the innovation process. As such it is a system of interconnected institutions to create, store and transfer the knowledge, skills and artefacts which define new technologies.* Metcalfe, S. (1995), “The Economic Foundations of Technology Policy: Equilibrium and Evolutionary Perspectives”, in P. Stoneman (ed.), Handbook of the Economics of Innovation and Technological Change, Blackwell Publishers, Oxford (UK)/Cambridge (US).” http://en.wikipedia.org/wiki/National_System_of_Innovation (March, 2013).

What is important for us is not the precisely definition even the idea of definitions belongs to the core within social science. As the different definitions indicate there exist research communities which focus on the link between a nation and its innovative activities. One solution could be to define the Black Box II as National Systems of Innovation as indicated above. From a practical point of view the acknowledgement of the existence of national systems of innovation means that much efforts have been implemented among different stakeholders like governments, ministries, regional authorities, research communities and consultants on a global scale in order to describe the systems and bring forward policy proposals and implement politics. With an increasing tendency during the last decades the area of innovation has been object to much attention. However, much attention among stakeholders has been with point of departure in a macro perspective and consequently such activity has influenced the

dimension of politi - or in a practical language the framework conditions for innovation activities.

What happens if we claim that the idea and focus on a national innovation system seems to represent an old-fashion way of thinking. We assume, that we need to include a more modern eco-system and sub-ecosystem into the idea of where the potential for innovation exist. Besides, because of our theoretical and practical assumptions that the root to successful and strategic innovation must be based upon the existing relations in the business a specific understanding of the business must also be incorporated in our way of thinking (Lindgren & Horn Rasmussen, 2014). The mission is - as mentioned in the ontology section, to expand the idea of the framework conditions and take an exclusive focus on a bottom-up perspective as a supplement to the macro-perspective, which in this context represents a top-down perspective. Taking the different definitions we ask ourselves which definition might work well at both a macro and a micro level? It seems quite reasonable that the Lundvall-definition works well at both levels: *“the elements and relationships which interact in the production, diffusion and use of new, and economically useful, knowledge ... and are either located within or rooted inside the borders of a nation state”*. Exactly his focus on elements and relations that interact in the process of production is vital. However, as we latter on will present, the question about use of only new knowledge is rather questionable linked to our proposed framework for Business Model Innovation. Our point of departure is the existing knowledge as the fundamental basis for any business model innovation process. Taking a further critical point the explicit focus on technology and new technology seems a bit to narrow related to our understanding. Technology and new technology is only one, however important, part of our business model innovation framework. If we go further into the ideas from Lundvall and his related research communities, we see how they find the research methodology should be dealing with studies around national innovation systems.

Box 8: How to Study National Systems?

Our interest in utilizing the innovation system perspective is not purely academic. We use this concept as a focusing device in order to better understand how innovation affects economic development at the national level. Within this broad view many factors contribute to innovation and it might be seen as a problem that almost all aspects of society need to be brought in to explain the actual pattern of innovation. To structure the analysis it is useful to distinguish between the *core* of the innovation system and *the wider setting*. Both need to be included in the analysis since the aim is to link innovation to economic development.

Firms and the knowledge infrastructure constitute the core of the system. In principle we include all firms in the core since every firm has a potential for developing, absorbing or using new technology.

The wider setting refers to institutions that contribute to competence building and institutions that shape human interaction in relation to innovation. These include, first, family pattern, education system, career patterns in labour markets, inequality and social welfare systems. Second, they include the historical record of macroeconomic stability and the access to finance. Third, they include the final demand from households and public sector organizations. Fourth, they include government and public policy directly aiming at stimulating innovation, including diffusion and efficient use.

This way of setting the scene indicates a marginal role for public policy. What is intended is rather to see public policy mainly as intervening in relation to the core and the wider setting of the national innovation system. Alternatively we could see public policy as endogenous. To some degree we take this perspective in Edquist and Lundvall (1993) where we demonstrate how innovation policy in Sweden and Denmark tends to reproduce rather than renew the strengths of the respective system.

Lundvall (2010)

We see that the research field within the Lundvall innovation paradigm operates with the core including all businesses. Besides, there are the wider settings defined by 4 categories. The definition seems as if anything matters. When we recall our methodological point of departure: Our postulate and consequently also our theoretical hypothesis is that we firstly is able to understand a business model, business model innovation and modulate its business model innovation strategy when we also consider the business models related to its out-out relations. This indicates that we also operate with the idea that anything matters from a potential point of view. Out-out relations are within our framework relations between elements which doesn't have – at least at a first glance – connections to the business models in the business in question. Exactly the out-out relations are important in real life business model innovation activities. It is not the same as to argue that the slipstream from a butterfly (the relation between the elements: a butterfly and the atmosphere) in South-America affects a business model in Scandinavia. However, theoretically we simply can't neglect a possibly relation between the out-out

relation and the business model. Having a global reference it is our claim that the surroundings to a business from a potential point of view can be defined as the national systems of innovation at a global scale. We know that this position challenge a scientific necessity with reference to building up demarcations, but we are going to demonstrate, that a demarcation at this step would ruin the idea of coming into the core of a more precisely understanding of Business Model Innovation and consequently the practical work of implementation of a business BMI-strategy. The reader may agree with us or the readers must accept our definition as an assumption.

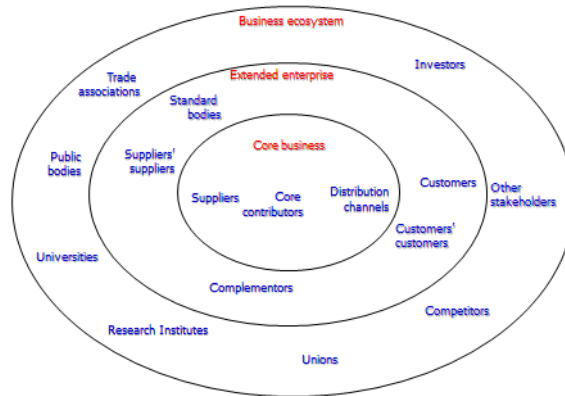

The main point to make an explicit reference to the idea of a national innovation system is that we, from a business point of view, bridge to our concept of the Relation-Axiom and the Business-Model Relation Axiom (Lindgren & Horn Rasmussen, 2014). And even more specific, we qualify the idea of our Out-Out quadrant or square. If a business experiences that much of the national system of innovation is placed in the Out-Out quadrant, the business may have a problem concerning their innovation activity. And surely, if many businesses in a nation experience the same, there is a clear indicator that the national system of innovation doesn't fit to the businesses in the nation. Then the nation has a clear mish-match and consequently a clear problem.

It is our interpretation that the ecosystem perspective contributes to the discussion about global systems of innovation and makes it more operational. Heikkilä and Kuivaniemi (2012) illustrates in their article "Ecosystem under construction: An action Research study on entrepreneurship in a business ecosystem" how the two black boxes can be folded out and how such picture can assist in practice in business model innovation process. The model is inspired by Moore (1993, 1996) and indicates their understanding of a business ecosystem. They operate at three levels of abstraction or "different layers", where their point are that the longer distance we are from the core business level the less commitment we have to business. The three levels are:

- System level
- Extended business level
- Core business level

Related to Lundvall we see that the idea of a core level is important. However, here the wider settings – if we again should compare with Lundvall – is defined by two different levels – extended business level and system level. The three levels consist on different contents which they illustrate in the following model.

The Finnish Business Ecosystem Model

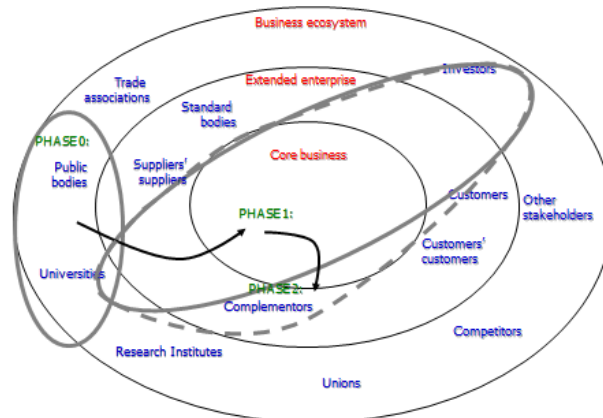

Heikkilä & Kuivaniemi (2012)

The researchers argue: “The core business layer consists of the parties forming the heart of the business. In traditional business, this layer would be run by a single company or the supply chain would be coordinated by the focal company. Alternatively, it can also be formed by a network of several companies each taking care of part of the core business. The next layer, the extended enterprise, widens the view of the business supply chain to include customers, complementors and second-layer suppliers, as well as standard-setting bodies in particular field of business. The outermost layers adds trade associations, unions, universities and stakeholders to the business eco-system”. Such are their definitions of the landscape from which an innovation occurs and becomes an integrated part of the core business. And precisely their description of the landscape forms an active role in the process of construction of an eco-system for innovations.

Their point of departure is similar with our purpose, because they also have observed how practitioners point out that “it is rather easy to come up with new ideas, but the real challenge is to put them into practice” (p.18). A major reason for this has a reference to the complexity of the surroundings. In their perspective the task is to concentrate the efforts around the innovation. “Instead, an ecosystem consisting of multiple expertises, capabilities and resources should be created around the innovation”----- where ”The aim

is to recognize the different domains of players that are or should be involved in the ecosystem under construction”(p.18).

The Finnish Business Ecosystem Model – From Phase 0 to Phase 2

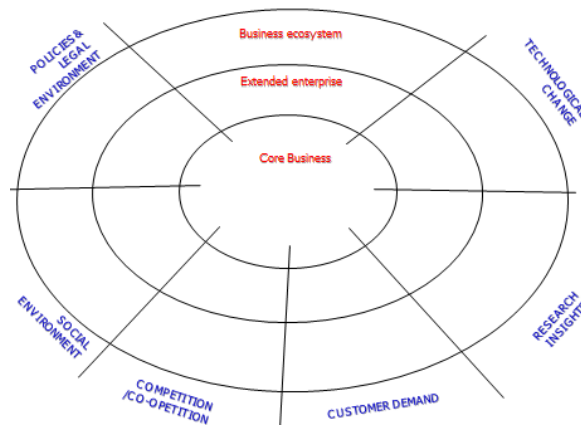

Heikkilä & Kuivaniemi (2012)

Based upon a concrete case – Physical Activity Prescription, a service innovation in preventive healthcare - they demonstrates why earlier efforts with the concrete case failed and how another perspective. This is illustrated in the next model. Phase 0 is the earlier efforts which had focus around the public sector and research institutions. Institutions placed in the outer layer compared with the core of the innovation. Phase 0 was public financed and the efforts to innovate stopped after funding stopped. Phase 1 is the situation when an entrepreneur took over. Point of departure was identification of actors who had a commercial interest in the new innovation. The key players identified by the entrepreneur were private medical clinics, pharmacies and the entrepreneurs own company. The value add in the new model comes from “an entirely new process consisting of tasks carried out in multiple organizations” (p.22). However, phase 2 is where the project is now (June 2012), because the question of the implementation of the innovation rest upon how to use new information technology and there is a need to build a prototype – proof of concept. This involves different business negotiation with information systems providers and health monitoring equipment suppliers.

As indicated much efforts and the starting point in the innovation strategy was concentrated far from the core of the core business. Based upon their research, literature and different workshops the researchers identified actual names on the potential players related to the innovation. Then they rearranged their former models and organized it with respect to sub-ecosystems. Their claim is that this model has a generic character (Heikkilä, 2013). We shortly present and comment on this model, which present a new kind of seeing the landscape for innovation activities.

The Finnish Generic Sub-ecosystems within the business ecosystem

Heikkilä & Kuivaniemi (2012)

Their model calls for two main points. First we have 6 different areas where the innovation activity must put attention. However, they don't comment whether we have potential actors at all the three levels in the different sub-systems. However and second, a main argument and point in their model is that they incorporate the notion of time – or as they pronounce it: clock-speed – in their model. They have arranged the sub-ecosystems with those systems with the highest velocity to the right – technological change – and the slowest to the left – policies and legal environment. According to their recommendations any innovation activity must pay attention to any of the sub-systems its planning. While most of the sub-systems doesn't need further introduction we briefly explain their idea about co-opetition. This notion covers the situation where competitors become a collaborator. The reasons can be many.

These models do in many ways enrich the idea of a national innovation system, because we find it goes a bit deeper into the concrete context from a microeconomic point of view. However, and we will argue for it, the models are still mostly inspired of the top-down or macroeconomic perspective. Even focus is the entrepreneur. This means that the models most of all call attention on what we initially named “The Black Box II” or the surroundings of the business. We are going to go more deeply and the task has reference to “The Black Box I”. One might say that the work of Heikkilä and Kuivaniemi contribute to a broader understanding of the innovations landscape, on the importance of different sub-areas and maybe most important the need to incorporate the idea of time and the different velocity or clock-speed that the different sub-systems represents, because all this influences if or if not the innovation becomes a reality and a successful or an unsuccessful innovation.

4.8 The Vertical butterfly as a hard core in the theoretical framework

Our mission is in many ways similar to the Finnish researchers. Theoretically we also work with the combination of an inductive and deductive methodology. However, our point of departure is the ideas about definitions formulated by Schumpeter. First of all we will abstract from the fact that Schumpeter only pronounce the idea of products, while his followers also speak about the idea of e.g. service. Within Schumpeter theoretical world also service can be argue to be a product. However and this is import we have to see at a central distinction in his framework.

“To produce means to combine materials and forces within our reach. To produce other things, or the same things by a different method, means to combine these materials and forces differently. In so far as the “new combination” may in time grow out of the old by continuous adjustment in small steps, there is certainly change, possibly growth, but neither a new phenomenon nor development in our sense. In so far as this is not the case, and the new combinations appear discontinuously, then the phenomenon characterizing development emerges. For reasons of expository convenience, henceforth, we shall only mean the latter case when we speak of new combinations of productive means. Development in our sense is then defined by the carrying out of new combinations” (Schumpeter 1983 (1934): 65-66).

This concept he argues covers 5 cases or as Casadesus-Manasell et. Al. (2010) name as five types of innovations: new products, new methods of production, new sources of

supply, exploitation of new markets, and new ways to organize business. With reference to Schumpeter Casadesus-Manasell et. Al. (2010) argues that much of the literature so far has focused on the first two types of innovation (e.g., Shan, Walker, and Kogut 1994; Banbury and Mitchell 1995; Eisenhardt and Tabrizi 1995; Schroeder 2006; Katila and Chen 2008; Leiblein and Madsen 2009; Roberts 1999; Adner and Kapoor 2010; Leiponen and Helfat 2010; Zhou and Wu 2010). Their study focuses on the last type of innovation, which they claim often is referred to as business model innovation. They further state that Business model innovation has become increasingly important both in academic literature and in practice given the increasing number of opportunities for business model configurations enabled by technological progress, new customer preferences, and deregulation. They further argue that BMI, at root, refers to the search for new logics of the firm, new ways to create and capture value for its stakeholders, and focuses primarily on finding new ways to generate revenues and define value propositions for customers, suppliers, and partners (e.g., Amit and Zott 2001; Magretta 2002; Zott and Amit 2007, 2008; Baden-Fuller et al. 2008; Casadesus-Masanell and Ricart 2010; Gambardella and McGahan 2010; Teece 2010). Further they state that business model innovation often affects the whole enterprise (Amit and Zott 2001) (Casadesus-Manasell et. Al. p.).

Our interpretation of Schumpeter challenge Casadesus-Manasell et. Al. (2010). Based upon our research we claim that:

1. Business model innovation is about any kind of innovation – process, service, product, market etc..
2. Business model innovation – at root and in accordance to e.g. Casadesus-Masanell and Ricart – refers to how to organize the different business models in a business.
3. Business model innovation – at root – refers to economic reorganization of the different business models in the business with reference to both a monetary and a non-monetary value formula in the business.
4. Business model innovation must have assistance from different tools in order to reach optimal results in the process.
5. Downloading – Seeing – and Sensing represent the main techniques in such process
6. The Cube organizes the process and secure a certain order
7. The relation axiom represents a tool which organizes the certain order into different perspectives

We now present our content of the Black Boxes – starting looking from a microeconomic and business point of view – *we go down – top.*

Much confusion occurs when we research upon the idea of business models or simply a business model. Among the research community the last decades have brought many contributions to increase both theoretical and practical research into the framework which to date has been unable to establish as a firm and scientific based paradigm. Our point of departure to contribute to the research community is the cube (Lindgren & Horn Rasmussen 2013).

The Cube is characterized by its 7 dimension – where the relations so to speak - kits the other six dimensions. By this procedure we get our CUBE.

The Cube

The Cube is a definition. Most simple it is a definition of a business. However, the Cube as definition operates at different levels of abstraction. Technically, The CUBE's can be dis-aggregated into 6 specific dimension and the seventh dimension, the relations, which kit the blocks together. The dimensions can be further divided into different components. Turning the attention to the eco-system of the business – we go down-top - we define different levels of abstraction.

1. Active Relations to Business Level
2. Resting Relations to Business Level¹¹
3. None Relations to Business Level

¹¹ Based upon our research we have found that it make sense – gives meaning – for a business to sub-divide this into resting relations to business level with a future potential and resting relation to business level which the business actively have chosen not to be potential for their BMI. The business knows the relation but has excluded the relation.

This can be illustrated as follows:

The first two levels of abstraction already is part of the business (and one may argue exist at another level of abstraction too). However, the two levels are characterized by having two fundamental different positions – an active and an inactive position. The third position reflects elements, which is un-related to the business level. In order to bridge to the “normal” understanding of the interplay between a business and its surroundings, we define the sum of all the three levels as the eco-system of the business. We could also name it as an eco-system platform. If we connect the above model to the idea of Business Model Innovation, it is obviously that it becomes very important that the business is very aware of which level they are investigating and which level they so to speak build and model. Exactly the existence of the different levels is the first indicator for how wide a potential any business has with respect to its innovation activities. Besides, it is a clear indication that in order to exploit the potential there need to be implemented much mapping time and consequently much analytic time as well. The second indicator for the wide innovation potential in any business has reference to the fact, that any business may or may not interact with more than one eco-system.

Any attempt to qualify the discussion of the idea of business model may as a point of departure take into account the idea of using the term “business model” at different levels

of abstraction. So far we have identified at least 3 archetypes – two microeconomic and one macroeconomic archetype:

1. A macroeconomic archetype: Business model as a long term reflection about how the economy is organized at a macro-level, among nations and among group of nations.

Lazonick (2010) point it out this way:

*“As Alfred Chandler documented in *The Visible Hand* (1977), by the 1920s the managerial revolution in American capitalism had transformed the organization of the economy.⁵ Over the next half-century, the “Chandlerian” corporation put in place what I have called the “old-economy business model,” characterized by oligopolistic competition, career employment with one company, and regulated financial markets. From the 1980s, however, this model began to break down, in part because of its own “financialization,” which began with the conglomerate movement of the 1960s, and in part because of the rise of Japanese competition, starting in the 1970s. The Japanese competed successfully against the Americans in automobiles, consumer electronics, microelectronics, machine tools, and steel, industries in which the U.S. companies had been the world’s leading mass producers. In effect, as I will argue in this essay, Japan outperformed the United States by perfecting the old-economy model”. Led by Intel and its microprocessor for the IBM personal computer (PC) and its clones, U.S. companies became world leaders in chip design. Indeed, the IBM PC and its “Wintel” architecture laid the basis for the rise of what I have called the “new-economy business model,” which by the year 2000 had relegated the old-economy model to history..... A particular business model is defined by its strategy, organization, and finance. The contrasting strategic, organizational, and financial characteristics of the new- and old-economy models developed initially in the information and communication technology industries, as laid out in Table 1. Of particular importance to the rise of the new-economy model was the change in employment relations within high-tech sectors.....the rise of the new-economy business model elevated the stock market to a position of far greater influence over the allocation of resources to innovative enterprise than it had occupied before..... The separation of ownership from control¹² occurs to some extent*

¹² As documented in Horn Rasmussen (2008) separation of ownership and control is far from a new event and far from a new paradigm. Horn Rasmussen describes how the American economist Thorstein Veblen 100 years ago introduced the change in how the organization of the economic operates – and in this context we may refer to this as a fundamental change in the business model - both with reference to the single business and the

under the new-economy business model when companies list on the stock market. Under this more recent paradigm, however, the stock market also performs compensation and combination functions. Through the offer of what came to be known as “broad-based” stock-option plans, the rise of the new-economy model relied for its success on prospective stockmarket gains to induce professional, technical, and administrative labor to leave secure employment at established companies for insecure employment at startups..”

2. Microeconomic archetype I: Business model as a term which is most adequate and analogue to a business

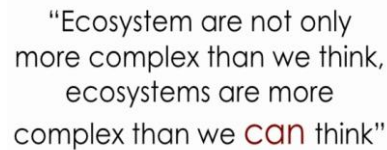

3. Microeconomic archetype II: Business model as a part of a business, which per definition contains of more than one Business Model

In our terminology we most of all concentrates on type 3. Type 2 is hardly a new issue and we use type 2 in order to define type 3. However, and this is important, the inclusion of type 1 is necessary, because this is here we get a reference to the idea of an eco-system which is a concept we from a macroeconomic perspective know from ecological economics and e.g. launched by Costanza et.al. (1997). From a business perspective we find the idea of an ecosystem e.g. within marketing theory. The relevance of the concept is e.g. expressed by John G. Singer, founder and principal of Blue Spoon Consulting Group, LLC, Minneapolis, USA. Singer (2006: 50) states:

“Advantage goes to those marketers who do the better job of designing ecosystems with mutually-reinforcing effects from internal and external assets, and managing the ecosystems for growth, innovation, and continual improvement”.

With other words: The idea of ecosystems is rather crucial for any business and we are going to contribute on how a business can exploit the concrete ecosystems within the process of Business Model Innovation. However, dealing with ecosystems and the theory behind it, we are moving into a really cross disciplinary arena where e.g. theory of biological systems, theory of ecology, evolutionary and co-evolutionary theory, network theory and marketing theory creates its own not well defined framework for a complex, ever changing system which are irreversible. As it turns out the demands to management and leadership in any business becomes both complex and challenging.

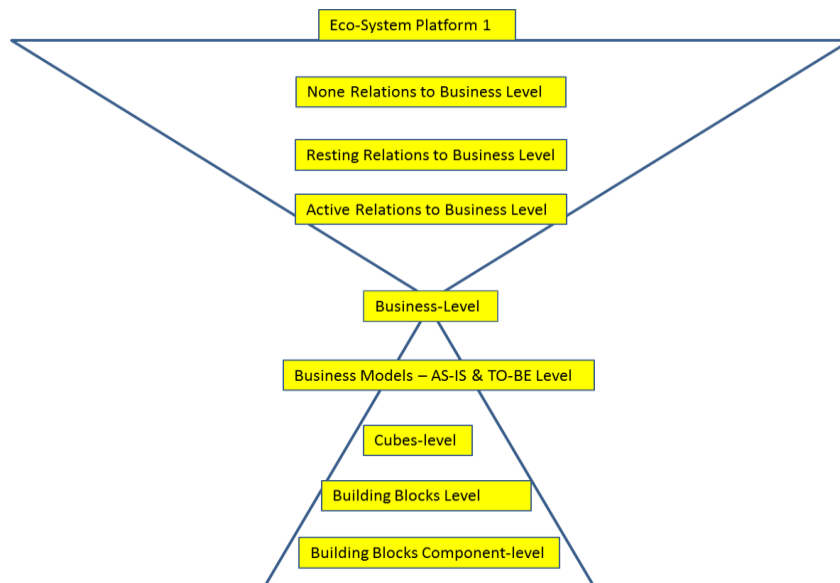

economy as a whole. However, we find that the analysis of Lazonick is a well capable description of how to operate with the idea of business model at a macroeconomic level.

"Ecosystem are not only
more complex than we think,
ecosystems are more
complex than we **can** think"

- PB Goley, 1993

As demonstrated we can talk about business models and business model innovation at different levels of abstraction. In order to be sure that we all are talking about the same, the model beneath may act as a guide. Originally we have got the inspiration from microeconomics and the discussion of the difference between transaction marketing and relationship marketing. While the first marketing concept focuses on the 4 P (product, price, place and promotion), the latter is focused on product benefits with high emphasis on customer service, communication and personalized relationship. Graphically it is illustrated with a butterfly and an inverse butterfly (Lindgreen, Davis, Brodie, Buchanan-Oliver, 2000). Inspired by the discussion, we name our model for "The Vertical Butterfly". However, contrary to the distinction in the marketing concept between a butterfly and an inverse butterfly, our model doesn't have any distinctions and doesn't chooses any concept. The model is just a description of how we want to organize ourselves before we start the business model innovation process. This means that the model act as a kind of theoretical memory card in order to keep us right on the road, driving in the right direction both in the mapping and the business model innovation modeling process.

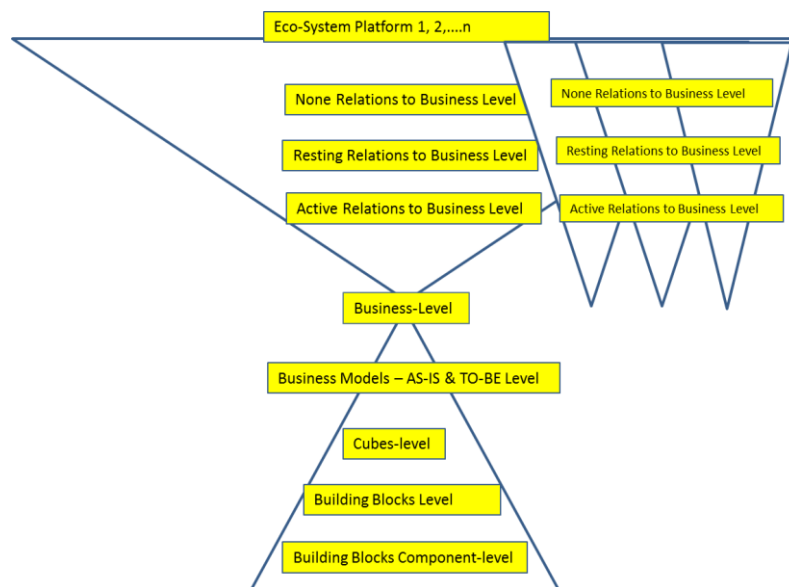

“The Vertical Butterfly – Eco-System Platform 1”

The general reflection and the rationale in the model tell that we can look upon a business from different perspectives of aggregation. In explanation of the model point of departure is the intersection point between the two triangles. We define the point as the level of a business. Going down from the point we disaggregate the business. When we go up into the eco-system we aggregate¹³. As a matter of logic we are able to disaggregate and aggregate into different levels. In our context it make sense at least to disaggregate first into the portfolio of the business. Within our framework the portfolio is defined as the existing TO-BE and AS-IS Business Models. Some would argue that we are at the level of business. However, within our context it makes sense to argue that our concept of AS-IS and TO-BE business models must be placed beyond the level of business, because this level simply is characterized by different business models which put together are an expression of the business.

We must imagine that we have different “Standing Butterflies” side by side. The point is that management who has such overview gets a lot richer, however also a more complex, picture of the business and consequently the business has a lot richer potential

¹³ In this discussion we abstract from the theoretical discussion about the atomic fallacy even we find the arguments for the problematic issue of summing all the micro and claim we have macro for quite convincing. However, we find that in this context the discussion is non-relevant because of our heuristic, theoretical purpose of making an attempt to contribute to a theory of business models and business model innovation.

position for the business model innovation process. We claim that the potential for the business model innovation process strongly increases. Potentially, we in practice can operate at different levels of the vertical level of dis-aggregation but now also from a horizontal perspective – We so to speak will argue that a further horizontal dis-aggregation will open up for an inherent potential of business innovation. While the dis-aggregation from a business level to the level of business models and further down to components is characterized as a vertical dis-aggregation this dis-aggregation is characterized as a horizontal dis-aggregation. The model beneath illustrate the new situation.

The Vertical Butterflies - Eco-System Platform 1,2,...,n and the Business

The model illustrates, that the business – at a business level – may or may not be bound together with different eco-system platforms. We will argue that such perspective opens for new definitions of any current business or any business on its way into a market. The challenge is how to put a business into a position, where the different levels and perspectives have been mapped and the situation for management becomes concrete for the business in question.

The idea is that there exist many eco-systems and the relevance from the business may alter as times go by. The potential is from a logical point of view the global economy and

consequently the total amount of eco-systems. This is the model around which everything revolves around.

A BM that is able to create and capture relations but not deliver, receive and consume value through relations to different BM Eco systems will not have the potential to be sustainable. Any model must consume in order to survive. A BM that is not able to receive and consume tangible and intangible values from its relations from different BM Eco system will only be able to develop its BM's competences and thereby eventually its BM's within the demands of the specific BM Ecosystem. Creation and capturing innovation of values will simply turn incremental and eventually not achieve a sustainable business model because the BM Eco system will turn into a BM Ecosystem with a red ocean character.

4.9 Releasing of IC in the BMI process in Eco-systems

So far we haven't defined IC. However, in order to link the idea of IC we must deliver our approach to IC and a definition of IC. We have two points of reference:

First of all we stress that IC is part of the Cube. Most obvious is the statement that IC is part of the component Human resource which is part of the competence dimension. However, our framework operates more open, because as a matter of fact, it is potentially possible to identify the idea of IC in all the seven dimension of the cube. This also indicates, that a specific focus on IC, from a theoretical point of view, doesn't represent an issue in itself. IC must be linked to a specific context and a specific BMI process. More precisely we use our strategy concept in order to make the focus on releasing IC or not. Our concept operates with an assumption and this assumption represents at the same time as a theory and a definition of strategy.

Our concept does not focus alone on the first part of BMI and IC release – the creative and creating part of BMI – related to different BM Eco systems. We also try to give answers to how business can capture, deliver, receive and consume relations and values of relations to different BM Eco Systems. Exactly the idea of create, capture, deliver, receive and consume is a main element in our theoretical approach which differs the approach from others dealing with BM, BMI and BMIL – Business model Innovation Leadership (e.g. Teese, Chesborough, Zott). Thus we propose business - although

managers typically regard BM Ecosystems and their relations to these as something that is constantly changing - to analyze and optimize their BM's relations to especially different BM Eco systems via the lenses of a BM Eco system relationship axiom. They could hereby reach IC and seek BM relations that continuously can take them to valuable IC – that could prevent them from being dragged into “red ocean BM Ecosystems” with rivalising industry characteristics (Porter 1985). The questions are - Which methods? and How to do this? This is not part of this paper but represents the practical challenges in a concrete BMI process.

5 Empiric illustrations and data analysis

The empiric research methodology is primarily an action research approach carried out in the time frame of 2010 to 2014. The findings represent learning and characteristic of BM's and BM Eco systems related to IC with reference to the multi business model approach (e.g. Lindgren & Saghaug, 2011, Lindgren & Horn Rasmussen, 2013). Mapping our findings with a theoretical reference to Veblen putting it into a BM ecosystem perspective enabled us – and the business - to get indications and elements to another and more complex picture of the framework conditions for BMI processes and consequently: - What is the business BM Ecosystems relations to IC?

We have chosen to illustrate from different research project where some of the projects are further elaborated in the “sister-paper” to this paper (Lindgren et.al. 2014). Consequently, we have been going from theory to the different case in order to identify potential links which makes sense. Such methodology doesn't verify any theory. However, the indications tell us that we might have some results which give meaning for the search for a research programme in the Lakatos sense. We are aware of our verifying focussed methodology must go close in hand with the proposed ontology and we are aware of a need to try to “shot our hypothesis down”. However, this is not part of the mission of this paper.

6. Discussion and practical implications

We have chosen different elements from different cases in order to discuss the theoretical approaches outlined so far. The first case is *the case of climatic change* and is

based upon articles in the Danish newspaper “Information” start of April to mid May 2014. Very briefly and with our theoretical context, the question is why the international community at a global scale has been placed in a situation, where 97% of all scientist who are actively involved are convinced that climatic change is a result of human activity. The UN Climate panel presented in April 2014 a new estimate where their prognosis launched a 4 degree increase instead of a 2 degree increase. The UN Chairman came with the most serious warning to the international community and appealed to global action now because of the fear for e.g. coming migrations, wars, food production troubles, increase in the level of the sea, destruction of cities and even countries etc.etc. Why are we still in such position where human life is threaten for survival? What are the theoretical explanation(s) from a Veblenian perspective?

Information (2014) quotes a new report from the leading European Stock company “Kepler Cheuvreux” with the title “Stranded assets, fossilised revenues”. The main conclusion is that the fossil industry is in a position, where they will lose 28 trillion dollars in the next 20 years if the international community intensifies efforts to protect the environment and tune to greener energy sources. 70% of the loss will come in the oil industry, 14% in gas companies and 15% in the coal industry.

A Veblenian position would argue that the fossil industry is the captain of industry, who will experience that their wish for stability is threatened by the green industry, which seeks for instsability to the dominating rules of the game. They want to be captains. They want to give direction. However, up to now there has not been – as Hvelplund (2005) would argue “A Clear and Strong Alternative”. Veblen would further argue that the absentee ownership in the fossil industry – we recall that we are in the modern system M2 – is a situation with only pecuniary goals. There exist not any alternatively way of rationality among the captains of industry¹⁴.

Veblen would further point at the mechanism that all politics is business. Consequently, this is an explanation that underpins why the process of climatic change has evolved. Up to now the institution of politics has supported the captains. If we look upon the other dimension – and politics as an institution – this institution might change

¹⁴ Remark that if the green industry becomes the captain of industry, the principles will not change according the rules of the game – also the green industry is characterized by its absentee ownership, which is the reason for pecuniary focus as the aim of business.

due to pressure from the outside (external pressure from the outside e.g. people, organization and businesses with other than fossil interests). In general and from a high level of abstraction Veblen makes sense to the case and the documentation could be much further expanded. However, finally we must stress the existence of “Make Believe” with reference to the evolution of the climatic change. The institution may be claimed to be very strong, when it is able explain that what is obviously bad and wrong is good and right.

The next case is the project Women in business. We had workshop with a group of Scandinavian women who owned their own business and the public support system which role – among other – was to support such entrepreneurs. From a Veblenian perspective the project indicated that there was co-existing of different rationality among the participants. Saghaug et. Al (2013) have further elaborated upon this and here we only make a few empiric illustrations. First of all, the women represent what Veblen calls “The Young Technicians. They want to change the way of doing business but they meet resistance among the old Technicians (The public system). Second, the young technicians believe that they are part of a M1 system. According to Veblen it is wrong. Whatever they believe they are part of M2 and the framework conditions of M2. Consequently, they becomes frustrated when the public support system (and here the public support system represent the mechanism politics and the institution politics) demands schedules for, how e.g. many new employees they can create (pecuniary aims in the optic of Veblen)? Job creation is one of the public systems mile stones for giving e.g. a project economic support. Turning the attention to the concrete BMI-processes in the WiB project the idea of working with different eco-systems instead of only one eco-system was implemented among some of the participating businesses. That illustrated for us as researchers that the idea of being explicit and concrete in the mapping, seeing and sensing process and involving more than one eco-system in the BMI process can lead to unexpected results in order to create a more sustainable business model.

The third illustration is rooted in a Swedish capital fond and their investment in 4 different businesses in Denmark – all with reference to the wind industry. For the first years after the investment the capital fond was an absentee owner. The idea was that the four businesses should be part of the same business. However, the results were not as expected because in reality one of the four financed the other three. The capital fond

decided to change position from absentee owner and took over the control. Their conclusion was – with reference to the context of this paper – that absentee ownership was not the solution to create a sustainable business and sustainable business models. Time must show if they are able to release the IC in the new position, or the case is another – e.g. that the IC in this specific business simply are positioned in a red ocean and has not shown the ability to move away. In that matter it is a question of need for another BMI strategy.

During a half year we have organized a kind of simulation with point of departure in circular economy. The idea was to create new business models for demolition of old houses and reuse of all the materials. Represents from the old industry and the new industry participated side by side with public official and a group of students who were the target group of the project. After 4 workshops the result was that all the good business models, the good intentions and the wish for a circular economy meet some crucial barriers. The most common was that the lack of common language in the beginning evolved into a kind of common language in the end – however at a very primitive and “pocket philosophical” level. They build an new local eco-system where – in principle – all the needed participant was rooted. That was what the participant thought. However, as a matter of fact at the last workshop it turned out that the most important actor – the local recirculation station owned by the municipality – was not present. And exactly this institution must be involved if any action shall be implemented. They are the local captains of industry from a Veblenian perspective. The other actor who was not present was Politicians. The institution of politics was represented by a up to 8 different public officials representing each own silo in the institution¹⁵. So, even if there exist wishes for releasing IC in this case, many barriers exist, which have more to do with the economic organization than the qualities of the IC. The project – even we are talking about a simulation – confirms that the general framework conditions for BMI-processes matters. Besides, the captain of industry – with reference to the relevant eco-systems within the construction sector, will from a Veblenian perspective still dictate the direction of the economic evolution. In this optic circular economy still is a niche and doesn't represent a clear and strong alternative.

¹⁵ *The institution politics are in this specific context quite complex because there are three different steering systems represented – each with their own autonomy.*

Generally, from the position of Veblen, the above illustration points at the institution of *politics* as important. There has certainly been an ongoing evolution of both policy and politics; but it is difficult to argue that a fundamental new order or any new fundamental rules of the game have been implemented. Similarly, the element of polity has shifted from a more local and national framework to an increasingly transnational and international framework. However, this is included in and how Veblen perceived this institution. As a theoretical point of departure, it seems most adequate to conclude that from a Veblenian perspective, the institution of *politics* is a stable institution. Taken as a whole the rules of the game have not changed radically, which leads us to conclude that, from a Veblenian point of view, we have an experienced structural change without transformation. The discussion of economic organizational change becomes a discussion of effects or consequences. Any of the indications demonstrated in the above are a logical effect due to the interplay between the mechanisms, the actors and the institutions. However, Veblen operates with an actor cavalry who acts teleological. This makes especially the institution of politics interesting because it implies that transformation can be decided from a Veblen point of view. Consequently, the framework conditions for BMI does have a potential to change if politicians decide it.

Within the general rules we ought to keep our attention on a dynamic actor cavalry and the immaterial change in values based upon changes in the idea of rationality. Within these rules, we have a theoretical argumentation for how it “ought to be”.

7. Conclusion

Trying to have a holistic approach we are forced to investigate if and how different approaches are able to work together. Our hypothesis is that point of departure is the idea of combining the approaches built on a top-down and down-up thinking, respectively. What we ask for is a need to establish a holistic approach in order to optimize the business model innovation work in a business. We must establish an overview that reflects the whole “battlefield” for a business. Our hypothesis for a contribution to a solution is to combine different perspectives of abstraction and then link these perspectives to the idea of a business and how a business is organized into a number of different business models operating in what we call the relation-axiom of business models. The hypothesis is that the relation-axiom of business models assists us in getting

an overview of the business. This is crucial before any attempts to do BMI strategically are taken by the business. Explain and understand BMI and the process of releasing IC may profit by integration of different perspectives of the economic system because taken together the perspectives reflect the framework conditions for the implementation of BMI. Summed up we have pointed on:

1. The Veblenian general theory which put the evolutionary economic business process into an institutional and actor teleological context contributes to enrich explanation and understanding of the economic process including the BMI process.
2. We have indications that The Veblenian General Theory enriches the explanatory power and understanding of the BMI framework condition at a macro level.
3. We have indications that The Veblenian General Theory enriches the explanatory power and understanding of the BMI framework condition at a micro level within specific fragments.
4. The hypothesis is that the idea of a national system of innovation is too narrow in order to explain and understand the economic process
5. The idea of a global system of eco-systems seems to enrich the discussion of framework conditions for releasing intellectual capital in the BMI process
6. Point of departure and a contribution could as a hypothesis be, that the idea of a business must be defined differently, where the idea of a business consisting of a number of different business models representing the portfolio of the business' "AS-IS" and "To-Be" business models seems adequate as a starting point.
7. The idea of a business-model as a cube has in our action research worked in practice. However, the idea of the need to break down the business not only into different business models but to break down each business model into different components seems interesting, and the hypothesis is that it enriches the explanation and understanding of the actual releasing of IC in the BMI process.

In the paper we presented what we as a hypothesis see as the research field for any business working and implementing business model innovation. The idea of defining and understand a research field at a general level of abstraction is the first demand to the business. When we talk about a general level of abstraction it is important to underline,

that the empirical feed-back up to now has been fragmentary. However, exactly this abstract world becomes concrete when any business goes through a BMI process. Any business is unique. The consequence will be that every business will have its own, specific and context dependent research field or what we have termed eco-systems. Of course different businesses will have a research field, which at first glance seems identical. However, our hypothesis is that such situation is by definition never existing.

8 Further Research

The Veblenian approach must be further integrated into the concrete modelling work if the usefulness shall be folded out. The macro focus is obvious. However, further action research may show if the fragmentary indications for explanatory power can be further elaborated.

University Address: Av. La Fontana 1250, Urb. Sta. Patricia 2da Etapa, La Molina, Lima, Perú

Structured Abstract

Purpose – The purpose of this research is to develop a learning system architecture, based on the knowledge management supported into a valid platform, for a globalized production training for disabled women, based on their capabilities, skills, and feelings as a tacit knowledge. In this context it is necessary to identify a profile which needs interaction with the virtual worlds. The process is completed through the developing of a model based on the interaction of the participants with intelligent agents, using the MPML3D language and which works through a collaborative learning process. The results are validated in a prototype for being tested and discussed.

Design/methodology/approach – Virtual worlds are part of the extensive field of "shared space" technologies, as are Augmented Reality, Telepresence and Virtual Reality, all discrete spaces represented and executed by computers and accessed exclusively through the Internet . Virtual worlds have technological capabilities to support the generation of knowledge and collaborative learning through the interaction of avatars (human-controlled avatar) and these ones with intelligent agents (avatars controlled by a machine), developing a collaborative information and training system, which in turn may support a platform for training and production of women with physical disabilities.

Originality/value – This research presents a model that allows women with physical disabilities to overcome their limitations due to physical constraints of the real world so they can become into productive and globalized persons, taking advantage from the economy of virtual worlds as Second Life.

The State of the Art of the above mentioned technologies, the specific characteristics of women with physical disabilities and the characteristics of virtual worlds, can generate capabilities that enable a collaborative learning through the interaction with intelligent agents (avatars controlled by a machine), which are able to answer frequently asked questions to avatars (human-controlled avatar), who in turn can generate actions from the agents within the virtual world. These agents allow a permanent support without the limitations of fixed schedules, personalizing the training without the barriers of the traditional process of education.

Practical implications – The practical implications of the model proposed lies in three main areas:

Productive women who overcome physical limitations due to their disability.

Learning environments, based on low-cost emerging technologies.

Globalization of people with mobility problems even from developing countries.

Keywords – Virtual Worlds, Intelligent Agents, MPML3D, Collaborative learning, Disable Women

Paper type – Academic Research Paper / Research in progress

1 Introduction

Virtual worlds are part of the extensive field of technology "shared spaces" as are Augmented Reality, Telepresence and Virtual Reality, all discrete spaces represented and executed by computers and accessed exclusively via the Internet. Virtual worlds have technological capabilities to support the generation of knowledge and collaborative learning through the interaction of avatars (residents) with intelligent agent avatars that can develop Information and training collaborative system, which in addition supports a production platform for women with physical disabilities.

This research proposes a model that shows how the characteristics of virtual worlds generate capabilities that allow effective collaborative learning experience and interaction with an agent avatar that can answer frequently asked questions to participant's avatars (residents) within the virtual world Second Life.

2 State of the Art

The state of the art shows the different aspects that provide with a logical context to the proposed model, such as women with physical disabilities, technological capabilities and the behavior of three-dimensional virtual worlds avatars (residents), involving intelligent agents as entities with interaction capabilities, intellectual capital management, collaborative knowledge management and collaborative work with emphasis on the environment and interactivity.

2.1 Disabled Person

Disabled people is a person with one or more physical, sensory, mental or intellectual

disability of a permanent nature which in interaction with various attitudinal and environmental barriers, do no exercises or may be impeded in the exercise of their rights and their full inclusion and effective in society on an equal basis with others. (General Law of People with Disabilities - CONADIS No. 29973- Peru). For a better understanding of this definition are two concepts linked with it offered by, Gonzalez, P. (2010).

a) Impairment: any loss or abnormality of structure or anatomical, physiological or psychological function. The deficiencies are a result of developing diseases, injuries or conditions of any kind, whether congenital or perinatal, but only part of the disease result in persistent deficiencies. In principal, deficiencies disorders represent organic levels."

b) Disability: Any restriction or lack of ability to perform daily functional activities in the manner or within the range considered normal for a human being. Disabilities are always the result of some deficiency, but they sometimes do not produce disability, so we could say that there are more deficiencies than disabilities. Disabilities represent functional disorders on the level of the individual."

We will not delve into this part of the gender-disability relationship but we offer some concepts that enable a better understanding about the need of building a model that places the PDW within a global production system.

According to the conclusions of the "First International Conference on Women and Disability" Valencia - 2003, "...gender and disability interacts placing disabled women in an unequal position compared to men and people without disabilities. Exist several types of barriers which stand between the physical, the communication and attitudinal. The latter are significantly affecting disabled women, resulting in a mayor invisibility, overprotection, lameness and performance of traditional female roles (mother, wife and caregiver)."

"Disability should not be assumed from the vulnerability but from the need to establish a new order through social participation, the visualization of women with disabilities, and the ability to actively participate in decision making in vital areas such the following:"

- Social and labor integration
- Health
- Leisure
- New technologies

- Women and Mental Health
- Justice
- Communication and Performing Arts
- Motherhood
- Sexuality

2.2 Virtual Worlds

We can use different approaches to achieve the definition of virtual worlds. From a technical perspective, Zapata said that a virtual world is a “discrete space, populated by a set of independent actors, which can be represented by a software program running on a computer“ (Montoya and Zapata, 2005). It is a computer-generated space in three dimensions, but it is not a continuous space as we experience in the physical world but discrete, consisting of virtual territories logically intertwined. The actors are independent because they determine their participation is autonomous without being subject to the other participants.

From a semantic perspective, López-Barajas indicates that it is right to refer to virtual worlds as Multi User Virtual Environments (MUVes), which are accessed through the Internet and where the interaction and communication is facilitated with themselves through an isometric polygons environment", with them the illusion of three-dimensional space (López –Barajas, 2009) is constructed. Strictly a virtual world is not a world but rather an environment, which in this case is generated by the computer using a web-based polygon structure properly integrated that produce the illusion of three dimensions that are accessed via the Internet.

These virtual environments simulated by computer may try to represent fantastic and unrealistic scenarios in some cases, while in others it can represent any kind of real world environment, including simulating real, such as gravity or the physical properties of objects physical behaviors, among others. People interact in these virtual environments using virtual representations of them called avatars, which in turn can be fantastic or similar to their physiognomies in the real world (Barreiro and Casado, 2009).

Zapata presents a philosophical perspective whereby MUVes design seeks to implement methods of distributed artificial intelligence, through a collection of autonomous agents that want to solve a given problem." The main idea of philosophy is to maintain a consistent world in which every action is justified by an effect, on either the

environment of the actor who performs or other pertinent actors" (Zapata and Montoya, 2005).

As seen in the definitions presented, virtual worlds are understood as computer-simulated environments in which avatars or software agents interact. However, they can also be considered as a new class of information system, one that combines the structural aspects of traditional systems modeling and simulation, with support systems for emerging knowledge processes that require knowledge of other disciplines as engineering design, computer graphics and computer simulation. (Chaturvedi, Dolk and Drnevich, 2011). To consider virtual worlds and applications developed within them as information systems opens up new opportunities to leverage the contributions of the methodologies of the discipline of information systems.

2.3 Technological capabilities and behavior of Avatars

The literature shows that the capabilities of virtual worlds to support team collaboration is based on only two of these characteristics, namely (1) the 3D environment itself in which participants are immersed and (2) the interaction based on avatars through which all communication in virtual environments are carried out. On the other hand, it also shows that there are different approaches to exploit the collaborative possibilities of virtual worlds in e- learning.

Learning through collaboration is one of them, and is what occurs when people work in teams, for example, solving problem or researching. The proposal is that the capabilities of virtual worlds for collaborative teams can effectively support collaborative learning.

The Effective Model for Collaborative Learning in Virtual World (Figure 1), based on the theoretical model of (Van der Land, Schouten, van den Hooff and Feldberg, 2011) about how capabilities of 3D virtual environments affect the processing of information and communication processes, leading to a shared understanding, proposes that the capabilities of the 3D environment and interaction based avatars have a proven influence on the two fundamental supports shared understanding: to support information processing and communication support, if these capabilities of 3D environments have a positive impact on teamwork. The study argues that effective group collaboration can have a positive impact on collaborative learning.

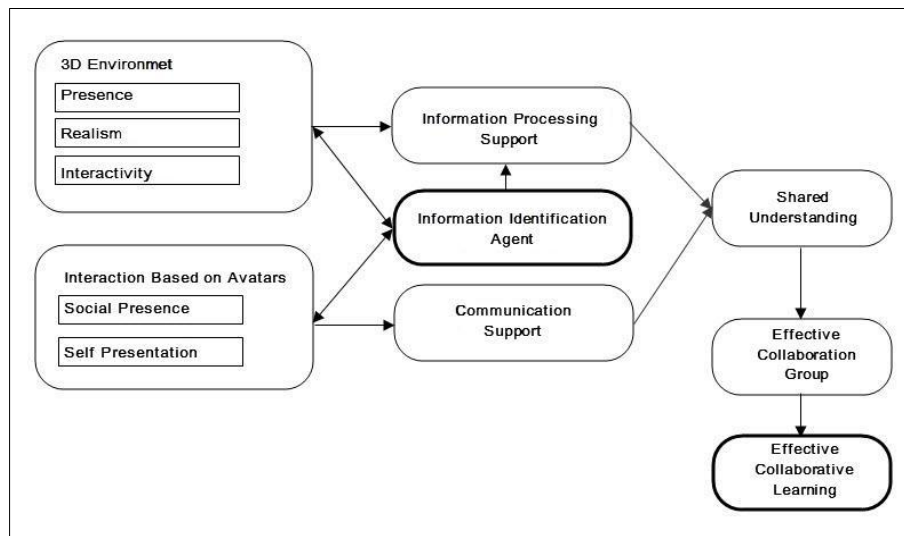

Figure 1. *Effective Model for Collaborative Learning in Virtual Worlds. Based on the theoretical model that shows how the capabilities of 3D virtual environments affect the processing of information and communication processes, leading to a shared understanding (Van der Land, Schouten, van den Hooff and Feldberg, 2011)*

They are precisely the technological capabilities of virtual worlds that allow this investigation to consider them as interactive spaces with potential for the development of people with physical disabilities, as have been manifested on these experiences in virtual world's users with disabilities or physical impairment.

For further reference you can view the video made by the Telemedicine Advanced Technology Research Center that offers a vision of what virtual worlds can bring to the lives of people with disabilities and how virtual worlds may provide an alternative learning interaction, work and socialization tool developed as a virtual support system for military amputees, the AVESS or the Amputee virtual Environment Support Space within the virtual world Second Life, https://www.youtube.com/watch?v=oUt2_C3SKIg

2.4 Intelligent Agents

An intelligent agent is a software entity that assists clients, based on their own knowledge, performs a set of operations to meet the needs of a user or another program, whether own initiative or any of these are required, as computer programs are capable of performing a task without direct manipulation of a human avatar. Agents have to learn the

essential characteristic of different ways: 1) by observing and imitating the behavior of the user, 2) Receiving positive or negative feedback from the user, 3) user receiving explicit instructions, 4) Asking advice to other agents (Lara and Martinez, 200).

According to (Bernuy and Lombardo, 2005) among the features that agents have, highlight be endless processes that run continuously, be able to act based on their experience and be able to move through a telematics net.

For us agents have new challenges in the design of an environment that includes the proper characteristics of the people environment and their personal characteristics and cultural patterns. This research analyzes the classifications available in table 1.

Table 1. Available Classifications.

Domain	Classifications
Field of Action	1) Desktop Agents (OS agents, application agents, etc.). 2) Internet Agents (search agents, filtering, information retrieval, reporting agents, mobile agents, etc.). 3) Intranet Agents (Customization cooperative agents, database agents, process automation agents, etc.)
Function	1) System Agents, 2) Filtering agents, 3) Profiles Agents; 4) Monitoring Agents, 5) Recommendation Agents, among others

From these intelligent agents we point up, three of them that relate to the topic: 1) Recovery agents: Looking, recover and provide information as authentic information managers and documents ("information brokers"), 2) Monitoring agents: give information to the user when a certain event occurs, and 3) Recommendation agents: helps users in three dimensions: information filtering method (demographic, content-based and collaborative), profile correspondence (when are based on the content) and the user profile matching collaboration techniques (Lara and Martinez, 2006).

2.5 Intellectual Capital

Intellectual capital, according to Benavides (2012), "is everything that cannot be touched but it can make money for the company. (...) the search for effective use of

knowledge, (...) the set of company assets, although not reflected in the financial statements, generate or will generate value for it in the future, as result of aspects related to human capital and with other structural as the innovation ability, customer relations, quality of processes, products and services, cultural capital and communications that allow to a company to take a better advantage of the opportunities than other, resulting in the generation of future benefits."

"Intellectual capital is the product of the interplay of human capital (knowledge workers, the ability to learn and adapt, etc.), Structural Capital (trademarks, patents, copyrights, product names and other assets intangible internal processes and research and development, etc..) and Relational Capital (business relationships with customers, suppliers, distributors, investors and other stakeholders: government and society in general), which is reflected on the ability of the human talent to add value not only to tangible assets but also intangible assets of an organization and generate or will generate future value on which you can consolidate a sustainable competitive advantage over time." (Benavides, 2012).

Furthermore we analyze the model DirCCI, "Collaborative Management of Intellectual Capital" where from the perspective of intellectual capital a way of integrating collaborative business rules is presented.(Bernuy and Joyanes, 2007).

Bernuy (2007) presents: (1) the address as an entity, (2) indicators of intellectual capital as a result of learning, (3) the environment that always releases changes or delivers rules of play, a collaborative system as the main component that instructs, shares and supports the decisions.

This new system is based on agents, and processes of transformation from human resources to structural capital and relational capital. This is when the organization creates knowledge and the most important elements are the innovation, competitive skills and human development ". Transformation processes are studied in other research called "intellectual Capital navigator" (Bontis, 1998). The transformation is based on rules we call "workflow" (Bernuy, 2007).

2.6 Collaborative Knowledge Management

Collaborative knowledge management requires "create synergy in organizations, in order to capture the knowledge in the people; the user needs to implement the effective collaboration between them." (Bernuy and Lombardo, 2005). Intelligent Agents and Multi

Agent Systems (MAS) are aligned to distributed systems that enable interoperability, communication, security, migration, and proper management of the environment and the necessary dialogues in virtual worlds.

The "Intelligent Distributed Control Systems based on Agents (SCDIA) allow collaborate: 1) Measurement Agent: collects the information needed to get the status of the process, 2) Controller Agent: take actions based on the state of the system, 3) Coordinator Agent: modified control agent decisions and sets new goals and services. Coordinates the agent community, 4) Actuator Agent: implements the decisions taken by the controlling agent, a coordinator, and / or specialized agents, and 5) Specialized Agents: they perform special tasks of the community of agents.

On the other hand the "Multi-User Virtual Environments" (MUVES) such as Second Life can be a great tool to educate people and to do research in a way that people learn. The use of automated agent's conversation with artificial intelligence capabilities can develop more interaction with people from identifying their human and emotional profiles.

3 The Proposed Model

The model presented (Figure 2) integrates the physical components and platforms in phases that involves, processes in some cases (e.g. Training in virtual worlds) and in other cases, microsystems (e.g. Opportunities Generation). The model is composed by three interfaces: input interface, transformation interface and output interface. It uses the Intellectual Capital as a generator of knowledge and the Collaborative Knowledge Management to generate a synergy between human avatars and intelligent agents. Interact into the model the Physically Disabled Women (PDW) as users, the virtual world itself and different gender of intelligent agents.

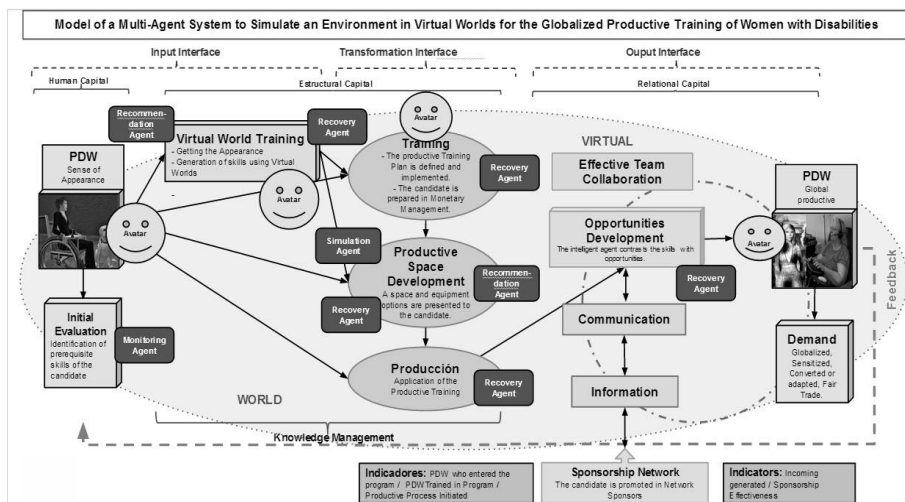

Figure 2. Model of Multi-agent System to Simulate an Environment in Virtual Worlds for a Globalized Productive Training of Women with Disabilities.

3.1 Input Interface

The model objective is the simulation of a virtual world environment for the productive training for women with physical disabilities, oriented to a global demand, and starts from an initial profile of women with physical disabilities, that considers within the tacit knowledge about this group, aspects such as the sense of appearance, degree of collaboration, confidence and the psychological and emotional condition of Physically Disabled Women (PDW).

3.1.1 Disabled Physics Women Profile

The term disabled women or disabled is a broad term, which includes women who have significant physical, sensory and/or intellectual deterioration, whether visible or not (...) which limits their performance in daily life activities (fend for their self, walking, seeing, hearing, speaking, learning, working, performing manual tasks, events and participate in community activities or breathing). Gonzalez, P. (2010)

The gender and disability interact to place women with disabilities in an unequal position compared to men and people without disabilities. Therefore, PDW suffer higher rates of marginalization and social exclusion that leads to a violation of the most basic human rights. Gonzalez, P. (2010)

"...This inequality is reflected globally for women with disabilities in higher rates of illiteracy; lower educational levels; lower labor activity and less paid and responsibility jobs; greater social isolation; lower self-esteem; greater economic and emotional dependence; greatest potential for all kinds of gender violence; less personal and social development; great ignorance of sexuality; low body self-appearance and many more situations that reflect this unevenness. Gonzalez, P. (2010)

The physical image of a woman in a wheelchair is an added element of vulnerability, however you can take advantage of other personal resources to succeed, though, without neglecting the care of personal appearance, because to forget the appearance accentuate the loss of self-esteem. Allué, M. (2003)

The binomial woman-disability suggests issues as employment and educational discrimination, violence and abuse, social isolation, low self-esteem and sometimes even lack of identity with the stereotypes of women. It could mean that gender and disability provided twice discrimination. Allué, M. (2003)

Maybe we should talk about vulnerability, more than double discrimination. Because after all, does not determine disability. (...) Is diverse and varies by grade; type of disability; the social, cultural and economic environment in which the woman moves, ie the binomial disabled- woman should not always and necessarily be associated with the idea of discrimination. Now, it is clear that the woman who lives in an environment where gender discrimination prevails, disability is an added burden. Because, in general, who usually discriminates by gender, also discriminate in other areas such as ethnic minorities or the same disability. Allué, M. (2003).

Contrary to what happens among people without disabilities in general employment services, there are not more women than men applying for employment in the offices of labor integration. Allué, M. (2003).

The profile of the woman who could apply for a job in such offices is that woman who worked before the deficiency or disease in a non-formal employment, usually without a contract, and low educational attainment. By acquiring deficiency, this woman definitely doubts about looking for a job with the added burden of limitation because maybe, in her case, that job would offer remuneration not identical but similar income. Allué, M. (2003)

There is a specific problem of cultural nature linked to social background and educational level of the actors that would explain the added vulnerability rather than

discrimination. Sociocultural constraints imposed even before the women arrive at the place of employment. But it is often not the case among women who return to previous employment after acquiring deficiency. (...) It is assumed in advance that work performance is now lower and that casualties will occur. Allué, M. (2003)

Sexual life is another doubt after the acquisition of a chronic disorder. The same people with disabilities explained that, at first, they feel desexualized; and women, for example, tell they are treated as 'friends' as possible but less than a companion. People with disability resulting from an accident, report that hospitals take too long to explaining how it will be their sexual lives when they leave, receiving as an answer when they ask: "not to worry about it now". Allué, M. (2003).

The physical improvement is encouraged but little the emotional: the sexual life has a secondary status. Experts add that the second concern is the request for permission, it means, some disabled women wonder if considering their new condition, is right to be interested in sex?, like if sexuality and emotional life would have been vetoed to them because of their condition. Allué, M. (2003).

Harris and Wideman cited by Gonzalez, P. (2010) suggests that women with disabilities, even they are subject to the laws of patriarchy, are excluded from their representations and symbolic order. Their explanation suggests that the position of women with disabilities in the sex-gender parent is absolute negation. Women with disabilities, according to their analysis, face a double invisibility, since neither fit the rigid stereotype of the "perfect body" or are left to exercise the traditional female role of motherhood.

3.1.2 Initial Evaluation

The candidate PDW responds a survey receiving the support of a Recommendation Intelligent Agent which helps users under three dimensions: the filtering information method (demographic, based on content and collaboration), the correspondence of the profile (when based on content) and the user profile matching with the collaboration techniques (Lara and Martinez, 2006). In the Initial Evaluation is where previous skill identification is effected of the candidate through the intervention of a Monitoring Intelligent Agent. The process is shown in table 2.

Table 2. Process of the Initial Evaluation

<p>a). The agent is fed into the virtual world server with an identification form (survey) of skills that includes:</p> <p>Skills acquired in the phase of training in Virtual Worlds.</p> <p>Previous skills acquired.</p> <p>Ability to identify situations of social interaction.</p> <p>Ability to generate alternatives that constitute a solution to the candidate’s training problem.</p> <p>Ability to make decisions, choosing the best alternative of all possible</p>
<p>b). The intelligent agent identifies the candidate by the avatar name and informs that will start the survey to identify the skills</p>
<p>c). The intelligent agent feeds a database with the results of the surveys.</p>

3.1.3 Training on Virtual Worlds

This is the first training node where the candidate PDW receives a base training in virtual worlds, which aims to build skills for the use of virtual world and interact within it.

At this point is included an external information, monitoring and evaluation management platform. The PDW candidate uses the external platform with the support a Recovery Intelligent agent (Training), which seek, retrieve and provide the information as authentic managers of information and documents ("information brokers"). (Lara and Martinez, 2006). This process is shown in table 3.

Table 3. Process of the Training on Virtual Worlds.

<p>a) The agent is fed into the virtual world server. In It the agent and the location where it should appear in Second Life is declared, the property of "listening" and the actions to be followed by the agent when "hear" the user in the virtual world are defined. The avatar agent is loaded by running the service SL_Frontend.exe (Second Life) and the agent appears in its position within the virtual world.</p>
<p>b) The intelligent agent “perceives” the presence of the user and provides information for access to the external platform and its usage.</p>
<p>c) The user PDW executes commands (questions) through the text chat, in this way the intelligent agent knows what to response and action to run on the interface. The agent will "listen" by chat commands that are sent by the avatars users that are in the position where the agent appears.</p>
<p>d) When the candidate PDW enters the external platform, can continue to interacting with the intelligent agent from the external platform through the server agent.</p>

The training in virtual worlds is developed in three stages:

a) Information Management. The PDW candidate receives information within the virtual world for accessing the platform. Log in and execute the training activities with the support of a Recovery Intelligent Agent.

b) Activities. The candidate performs the training practice activities development within the virtual world being supported by a Recovery and a Monitoring Intelligent agent

c) Evaluation. The candidate receives information within the virtual world to perform the training evaluation activities supported by a Recovery Intelligent Agent.

3.1.3.1 Training Prototype in Virtual Worlds.

The training in virtual worlds and as the productive training platform includes the participation and usage of an environment that comply with fundamental characteristics:

a) Adaptability: Responds to women with physical disabilities needs

b) Ubiquity: Can be used from non-traditional areas of training, i.e., outside of an educational institution (home, office, cabins, etc.).

External training platform and virtual worlds can be used by women with disabilities based on the fundamental characteristics mentioned above.

Montoya Sanchez, (2006) cited by Zappalá says that to establish the use of new technologies as a promoter element of inclusive education, some proposed criteria should be considered from the ideas of universal design, which considers the needs of all potential users (Montoya Sánchez , 2006), because they are not always necessary or desirable special programs for people with motor disabilities. (Zappalá, Köppel and Suchodolski, 2011).

The phase of training in virtual worlds is designed to provide basic training that should be received by each female candidate with physical disabilities through information, practice and evaluation in order to develop skills that allow them to function within the virtual world and therefore get closer to the goal of productive training. These basic skills are concentrated in a setting that involves issues such as:

- Movement in the 3D environment
- Voice and text communication
- Basic management of appearance

Once received this training the PDW candidate will be suitable to receive and develop specialized training in the designed productive activity for each candidate according to their previous skills and the skills developed at this stage, so this step not only instructs them to function acceptable within a 3D space, but also provides information to continue the transformation interface, specifically in the phase of productive training.

Programming the training in virtual worlds is divided into units, which are interrelated and each is composed of lessons. The methodology considers two fundamental aspects inherent to women with physical disabilities, which are runtime in each lesson and the degree of disability as a response resource, which makes necessary that this training in addition to be well supported by the technology of virtual worlds, combine the use of other technology support as the external training platform, which includes the use of audiovisual material such as presentations and videos, to facilitate the learning process for the PDW. A prototype of this training program is shown in table 4.

Table 4. Virtual World training Prototype.

Unit 3 - Avatar Appearance

Synopsis: Understanding the relevance of the identification of the avatar, this unit covers the process of recognition of the appearance, change and modification thereof as a tuning tool and finally addresses the organization of the elements containing the appearance to the proper administration of items.

- 3.1 Introduction
- 3.2 Discovering Avatar Appearance
- 3.3 Changing the Appearance
- 3.4 Modifying the Shape Appearance
- 3.5 Modifying the Skin Appearance
- 3.6 Organizing the elements of Appearance

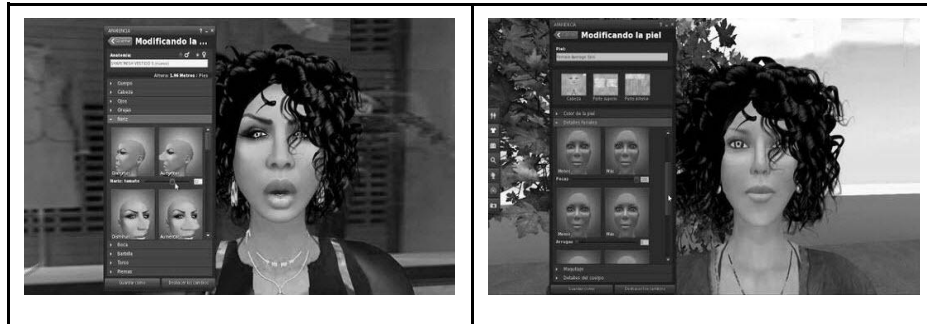

3.1.4 Getting the Appearance

In this phase, as we can see in table 5 and table 6, and in addition to the corresponding intelligent agent, the PDW candidate will be supported by avatar appearance software, a tool inherent to the virtual world Second Life. The PDW candidates generate an avatar image similar to their real appearance, with the support of and Monitoring Intelligent Agent, which "provides information to the user when a particular event occurs" (Lara and Martínez, 2006).

Table 5. Process of Getting the Appearance

a) Monitoring Intelligent Agent "answer" to the PDW candidate to the request for modifying the appearance, through a keyword given as a command to the agent in the virtual world by the candidate.
b) The avatar appearance software within the virtual world allows editing personalized avatar shape.
c) The candidates are assisted by the Monitoring Intelligent Agent, this will indicate to the candidates the use of this tool, step by step to achieve a change in the original appearance, approaching to their real appearance.
d) The intelligent agent is programmed to identify keywords on the modification appearance process of, so that the candidate can ask for information during the process.
e). Once the candidate inform to the intelligent agent, the process has been "completed", it is registered into a database by the intelligent agent indicating the candidate is ready to continue to Virtual Worlds training.

Tablet 6. Appearance Tool in Second Life.

3.2 Transformation Interface

In this interface, structural capital is involved, it is defined, designed and implemented the Productive Training Plan and it is involved the management external platform of information, monitoring and evaluation, such that it is generated the productive equipment and space, and the PDW candidate is formed in virtual currency management with the support of Simulation, Recommendation and Recovery Intelligent Agents.

3.2.1 Training

The training platform aims to develop abilities, skills, habits and behaviors related to employment of women with physical disabilities. Therefore, seeks the empowerment employment of women physical disabilities to enable their integration into the world of work.

3.2.1.1 Training Plan

a) Evaluation phase. At this Phase it is evaluated the degree of disability and the specific conditions of women with physical disabilities as well as their degree of access to technology resources to be used in training, from their own condition.

b) Content and Programming Phase. Based on the evaluation of automated Input Interface and stage of evaluation mentioned before, it is defined the activity on which will train the PDW candidate, developing the content and schedule training.

c). Productive Training Phase. At this step is carried out the training in the elected activity, supported by an external platform, intelligent agents and within the virtual world.

These phases are carried out supported by Simulation, Recommendation and Recovery intelligent agents. The productive activities in which the candidates will be

trained can be both traditional production of goods or services; or virtual goods and services as is shown in table 7.

Table 7. Type of Services or Products involved on Second Life Training.

<ul style="list-style-type: none">- Handicrafts: Wool Fabric, Objects Straw, Textile in loom, Fabric Dolls, embroidery, patchwork, pottery, etc.- Digital items: Cloth, and Accessories.- 3D Building: 3D virtual Environments and items, etc.- Streaming: Video and Music.- Programming: Scripting in Second Life, Softwares.- Design: Clothes, Spaces, Items.- Translations: Documents, events in world, etc.- 3D Modeling: Real and virtual items.- Digitizing: Documents, items.
--

Training should continue with the labor incorporation into a competitive or protected job for a disabled person.

3.2.1.2 Monetary management

The Recovery intelligent agent supports the PDW candidate on monetary management. Into the Transformation Interface it is necessary to complete the process providing the necessary knowledge to the PDW candidate for the monetization of the income obtained, i.e., to have access to it. This orientation will depend on the activity and type of product or service.

a) Goods and/or traditional services: There are included in this definition the tangible goods or services consumed by virtual or physical way but not within the 3D environment (crafts, design, etc.). In this case the orientation is based on basic financial information, accounts management in national or international currency, exchange process, deposits and transfers, payment and transfers information for customers, shipping charges and receiving transfers.

For this case, it would be made an agreement with a local financial institution for providing access and information to this new group of producers (PDW), to grant the necessary facilities on the monetization process and the control of the acquired finances, with non-complex process.

b) Goods and / or virtual services: There are included within this definition intangible goods or services virtually consumed in the 3D environment (digital objects, modeling, streaming, etc.). In case the orientation is based on basic financial information, which allows the PDW to monetize their gains, being able to convert the virtual currency into international currency and transfer their incomes from the virtual world to an account into a local financial institution, in addition to all previously mentioned in the case of goods and/or traditional services.

It must be noted that the currency used within the environment Second Life is the Linden Dollar (L\$), which has a market value approximately of L\$ 270 Linden Dollar per U.S. \$ 1.00 at the time of writing this article.

This means that any transaction of purchase and sale of products and/or services within the environment or through the website of Second Life takes place in L\$, i.e., after the sale by the PDW producer, it is necessary to conduct a L\$ sale process, plus a international currency conversion from U.S. \$ to local currency, and finally the transfer of profits. For this purpose, there is a complete protocol provided by the monetization platform of Second Life that involves several aspects and threads as:

a) Buy Linden Dollars (L\$): This process is necessary in order the PDW producer to be able buy items needed for the productive work. To perform this transaction it is essential to register a payment method which can be electronic debit or credit card or even through a payment account. in order the PDW can perform this type of operations is that the agreement with a financial institution would be sought. Relying on the above requirement the process of buying L\$ is very simple, consisting only of defining the desired amount and purchase through the website of Second Life. (Figure 3,4).

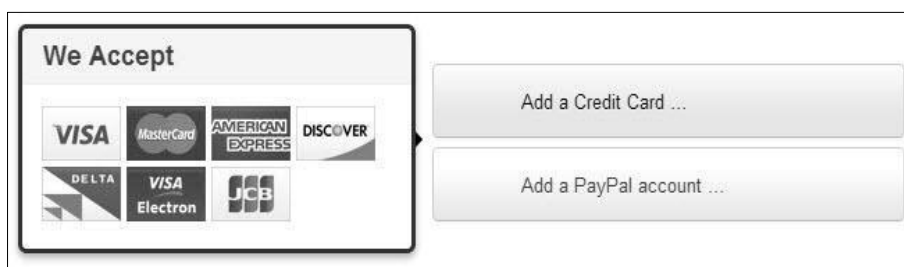

Figure 3. Alternatives to purchase the virtual currency (\$L) in Second Life

Figure 4. Lindens Dollar purchasing process in Second Life web site

The lindens paid by customers who buy the products and/or virtual services within Second Life are credited to the supplier account in dollars Lindens, through a sale platform also provided by this virtual world and also serves to promote and market the products available to customers. <https://marketplace.secondlife.com>. (Figure 5).

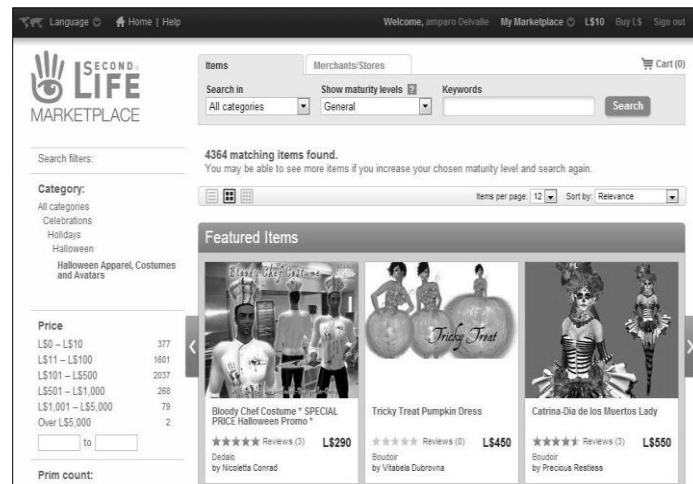

Figure 5. Marketplace. Second Life sales products platform

This platform allows the product inventory management, transaction tracking, updating and removing products, define segments for each product based on its category and/or type, etc. Once made the sale the Monetary Counseling allows to the PDW provider to submit the monetization process.

b) Sale Linden Dollars (L\$): LindeX™ is a unit of exchange which offers to Second Life residents the ability to purchase or sell Linden dollars. When a producer sells lindens that have gained from the sale of goods or services within Second Life, deposits or payments will be made using the same method registered for purchases, that is, a debit or credit card, or payments account (e.g. Paypal). There is a fee for both purchase and sell Linden Dollars, prices on this site are set by the market price. (Figure 6).

LindeX™ Exchange: Sell L\$

Just tell us how many Linden dollars you'd like to sell, and the LindeX™ exchange will automatically match you with buyers.

Sell Orders may be partially filled: Your Linden Dollars might sell to multiple buyers, and not all at the same time, and will remain open until they're sold or you cancel the order. Proceeds are paid at the time of sale, less transaction fees.

For limit sells and detailed market information, visit the Linden Dollar Exchange Settings for your account and set it to "Advanced".

After clicking the "Offer to Sell" button you will be presented with the login page and will need to resubmit your login information to confirm this transaction.

Sell Linden Dollars (Market Sell)

Buy	US\$2,489.62	US\$2,489.62
Sell	US\$2,500.00	US\$2,500.00

Your Remaining Account Billing Limits

	per 24 hours	per 30 days
Purchase	US\$4,989.64	US\$4,989.64

Figura 6. LindeX™ Currency Change Unit from Lindens Dollars to U.S. Dollars

Second Life keeps residents and suppliers generally informed about the movement and fluctuations of its currency respect to the U.S. Dollar \$, in order to provide the best options at the time of purchase or sell Linden Dollars L\$. Besides this monetization platform allows residents to track transactions for both, buy and sell.

3.2.2 Productive Space Development

It is presented to the PDW candidate simulated space options and equipment. In this phase an internal tool to “materialize” (Rez) spaces is used with the support of Simulation Intelligent Agent, which replicates items and group of items (offices, factories, rooms, etc.) through a spaces script. This phase also involved Recovery and Recommendation intelligent agents.

To generate a Productive Space comprise the creation of a tool called Holodeck, which is a product used to store different forms of content (either the furniture or even setup a complete environment), similar to the holodeck term used in science fiction programs and movies. Within Second Life, a holodeck allows to materialize (rez: to place

within the virtual world) a variety of scenarios in a room or defined space.

Some systems even allow the scene to be away from your control panel, offering the convenience of rez-on-demand structures without taking a great big space in a region.

The specific use of the engine Holodeck on the generation of productive space provides to the PDW candidates a production and learning space that will enhance the service or product for the selected activity, that space also constitutes the representation of equipment that can be used for productive activity.

3.2.3 Production

The producing formation or training in the virtual world is applied, ie, production runs depending on the type of product or good and the selected activity since the start of the whole process. In this phase it is a Recovery Intelligent Agent involved

3.3 Output Interface

This interface is contained in the framework of effective team collaboration, receiving environmental intervention of a sponsorship Network, through the process of supporting information and communication. It promotes the PDW candidate into the sponsorship network.

3.3.1 Sponsorship Network

This phase involves a series of activities to achieve support from companies or institutions for the PDW candidate to carry out the production and marketing on the activity the candidate was trained.

To promote on the sponsor web site the products or services provided by the DPW candidate, use the institutional sponsor logo for the promotion and/or marketing of goods or services produced by the PDW candidate and the sponsor participation or representation in the sponsored activity.

Sponsorship is given when actions are aimed at:

Commercialize the developed product; promote the program carried out by the PDW candidate and to encourage other beneficiaries to carry out the program.

The beneficiaries of the sponsorship would be of women with physical disabilities who have completed the process, it means the three interfaces of the model presented, which will constitute the only required condition.

The sponsorship is awarded to each PDW candidate and its validity corresponds to the agreement between the candidate and the sponsor, with a minimum pre-agreed defined time.

3.3.2 Opportunities Development

This part of the model is framed within the relational capital and is supported by an Recovery Intelligent Agent. The intelligent agent contrasts the skills developed by the PDW with opportunities identified, based on the information derived from the automated evaluation. The process is shown in table 8.

Table 8. Process of Opportunities Development

a) The agent is previously fed within the virtual world server with a database of training and development opportunities for women with disabilities.
b) The Intelligent agent Contrast the database opportunities with skills database generated through the automated evaluation and generates a report that reflects that contrast into a opportunities diagnostic.
c) The opportunities diagnosis is the basis for the development of the productive space and the production equipment, and also for the productive training platform, because depending on the PDW candidate skills a specialized training will be designed.

The PDW finally become into a globalized productive unit, set as a Global provider for a sensitized, converted or adapted demand, based on the principles of fair trade.

4 Conclusiones

Virtual worlds have unique abilities that set them apart from other forms of interaction. Among them, the 3D environment and avatar-based interaction can support the processes required for effective team collaboration, enhanced with the support of intelligent agents that impulse the collaborative interaction among other reasons, because the intelligent agent can simulate the behavior of the user and they can adapt to their environment .

Effective team collaboration in virtual worlds, through knowledge management in collaboration, can lead to an effective collaborative learning.

Through MPML3D platform can be easily achieved in the form of intelligent agents

within Second Life avatar that can enhance learning in virtual worlds with avatars interacting handled by people.

The convergence of knowledge management, intellectual capital, intelligent agents and virtual worlds allow effective collaboration, fostering knowledge transfer and effective learning.

The possibility of interacting with intelligent agent provide to the Women with Physical Disabilities the opportunity to be trained on different issues of the labor context, which can introduce the into the a functional work, in that way they can have a mayor benefit which is to overcome their physical limitations.

The cost of simulate a learning environment within the virtual world Second Life is low in comparison with to the cost of building and implementing environments in real world. In addition to this, being able to access to the virtual world from anywhere and at any time (cause it is a persistent environment) make this 3D platform ideal for people whit physical disabilities.

Virtual worlds as Second Life are inhabited by people from around the real world which extends its globalizing feature, due to it allows to any person, but specially to people with mobility problems, to emphasize their acquisition of knowledge from other residents and in other wise to attract more and diverse segments to sale their products or provide their services, such as handicrafts or digital modeling.

Structured Abstract

Purpose – The present work focuses on the study of healthcare networks as key tool for innovation creation and spreading, by deploying the emergent paradigm of *open innovation*. During the early development of a technology, when the interactions among component types are unclear (in a state of flux) and, therefore, difficult to codify and freeze, organizations build connections with research centres and universities to explore alternative technological solutions. Once such interactions are better understood, codified, modularized and shared, then more exploitative networks (e.g. with suppliers and customers) may be better suited to exploit the current technology.

Design/methodology/approach – The explorative analysis conducted refers to the healthcare sector, since its complexities and singularities are called to deal with new organizational issues. To this purpose, a preparatory desk analysis was determinant in order to find out the existence, within healthcare facilities, of organizational forms similar but not exhaustively matching with the main features of open innovation..

Originality/value – This methodology puts in evidence how evolved policies of open innovation lead to a systematic realization of process of knowledge exploration, exploitation e retention, both inside and outside organizational bounds; it becomes so necessary for the involved actors, to develop relevant networking skills, in order to properly handle the whole set of innovation process.

Practical implications – In the transition from the early development phase to the more mature phase, firms must build ties to startups and new entrants, and/or connect to third-

¹ § @@

² § @@

party firms, since the supporting investments made by these firms may determine which of the alternative configurations will become ‘the standard’. During this stage, the relationships across firms are defined and governed by modular interfaces that are, in turn, dictated by product interfaces. The outcomes of the present analysis mean to highlight a comprehensive perspective for understanding the dynamics of modularity and their implications for innovation networks. The main goal of the paper is therefore to show the ways through which the dynamics of technology development should reflect the dynamics of knowledge transfer of a healthcare firms network.

Keywords – HCOs, Informative Intellectual Capital, ICT Healthcare, Open Innovation, Knowledge Management, Paradigm shift

Paper type – Academic Research Paper

1 *The open innovation: a theoretical framework*

The *open innovation* paradigm was born in opposition to the pre-existing *closed innovation* one³, deployed in many cases with extreme difficulty because of factors like the increasing of qualified subjects, as well as multiplied external options for innovation development (such as *venture-capital* and *start-ups*), the presence of highly qualified third parties, up to a much more rapid *time-to-market* (Chesbrough, 2003). The recent organizational literature focused on a particular feature of the open innovation, meant as a “*a paradigm that assumes that firms can and should use external ideas as well as internal ideas, and internal and external paths to market, as the firms look to advance their technology*” (Cfr. Chesbrough, 2003, p. xxiv)⁴.

Further developments brought to shed light to a more evolved framework that provides an integrated perspective to the knowledge management issues within the open innovation (Lichtenthaler, 2007), and articulates in three critical processes:

- *Knowledge exploration*: the *outside-in* process (*inbound innovation*) means either the opening of any corporation innovative initiative to a process of generation of new knowledge from the inside, or the acquisition of new knowledge from outside subjects and sources;

³ It requires a strong control activity on all the innovation phases (ideas generation, development, marketing, financing and support), that need to be performed within company bounds and exploiting internal assets and resources.

⁴ “Open innovation means that valuable ideas can come from inside or outside the company and can go to market from inside of outside the company as well”.

- *Knowledge exploitation*: the *inside-out* process (*outbound innovation*) means either the internal deployment of knowledge (*intensive capacity*), or the process of external transfer and commercialization of corporation knowledge (*absorptive capacity*) (Cohen, Levinthal, 1990);
- *Knowledge retention*: resulting from the combination of the mentioned *inside-out* and *outside-in* processes, if deployed inside the corporation, allows to store the produced knowledge inside organizational bounds during time (*transformative capacity*); conversely, knowledge is kept outside the organization (*connective capacity*) (Lichtenthaler, 2007) through the implementation of inter-organizational relations, that feature as sort of extension of the original internal corporation knowledge (Grant, Baden-Fuller, 2004).

An actual open innovation action systematically affects each knowledge exploration, exploitation and retention process, both inside and outside the organizational bounds, marking thus out the innovation process as a whole. As showed by many scholars (e.g. Gupta, Tesluk, Taylor, 2007) innovation is a multilevel phenomenon: management issues at a certain level may not lead to positive effects, depending on not suitable factors from other levels – such as bad attitudes at organizational level for one or more individuals. It becomes so necessary for the organizational actors involved to acquire huge capabilities to deal with the innovation: people's attitudes, as said, may in fact as allow to help to achieve high levels of organizational capabilities within the corporation, as hardly hinder a proper implementation of the open innovation dynamics – including the decisions needed at project level (Lichtenthaler, 2007). As for the *knowledge exploration* processes, the *not-invented here* concept is particularly relevant, since it refers to a negative consideration, from corporation employees, towards the knowledge explored outside: this can origin from limited (or negative) experiences related to outside-in knowledge transfer processes, as well as from inappropriate incentives systems for figuring out and implementing external knowledge (Chesbrough, 2003). The *knowledge retention* field brings with it the *not-connected-here* idea, that means the disagreement, from corporation employees, as to the external retention of corporate knowledge. As for the *knowledge exploitation*, instead, the *not-sold here* attitude means the disagreement, from corporate employees, towards the transfer of corporate knowledge from inside to outside, that makes thus it available to third parties (Chesbrough, 2003), that may turn out as competitors that would take advantage from relevant corporate technologies (Lichtenthaler, Ernst, 2007). The opposite *sell-out* attitude means the positive propension

to transfer knowledge outside the corporation bounds: this may come after the good results of the pioneering active policies of *licensing*, or conditioned from pressing on R&D processes (Lichtenthaler, Ernst, 2007).

Balancing such three critical processes, as well as the often complementary corporate inside and outside issues, becomes a basic requirement in order to develop the necessary organizational capabilities to properly handle all the open innovation-related dynamics (Cassiman, Veugelers, 2006; Grant, Baden-Fuller, 2004).

1.1 Criticisms to the open innovation paradigm

If on the one hand the open innovation contrasts the closed innovation both on theoretical and empirical bases, on the other hand supporters of the closed innovation claim that aspects related to a synergic logic and a native openness towards innovation processes were already taken into account. By the way, it is well known that the closed innovation paradigm considered the presence of high levels of technology outside corporate bounds (Allen, Cohen, 1969) as a key element to give origin to a set of relationships between the corporation and its surrounding environment, potentially able to increase R&D performances. Similarly, literature about innovation emphasized the importance of such connections, since they make ideas and projects able to be actively shared. Besides, authors like Nonaka (1991) support such vision with empirical contributes, stating that the creation of new knowledge within the organization depends on its capability to recognize the tacit knowledge from its employees, and make it available to be implemented in every process, both internal and external.

2 The *upstream* logic

Many scholars proposed to rework on the concept of *openness* as for innovation studies, highlighting the issues related to the availability of knowledge to all the interested parties, with the upcoming risks of uncontrolled access. The existing approach may be therefore intended as expression of a weak logic, while an *upstream* vision would provide a stronger one.

Starting from the concept that knowledge and innovation should be shared, so that each actor can as take advantage from them as integrate them, Chesbrough points out in fact that those, even circulating among a wide number of subjects, will tend to remain confined inside such circle of people, until for instance research results remain secrets, or subjected to aggressive policies of restricted access. The upstream supporters describe

such dynamics as a weakness of the open innovation paradigm, while emphasizing the importance to make resources available and accessible (e.g. Lessig, 2004). According to this new understanding, the “new” concept of open innovation should comprise three constitutive features: (i) a voluntary recognition of knowledge from those who take part to the processes of knowledge creation; (ii) a knowledge status that becomes “open” (according to what previously stated); (iii) continuous interaction dynamics among participants. This means that, at least in theory, every subject can take part to the process of knowledge creation and sharing, so that every subject can be recognized as a participant.

The first point basically means that corporations as well as single subjects involved in any *open innovation*-related process are strongly motivated and capable to somehow “drive” the knowledge flows, which are not thus to relate to undesirable *spillovers*, or externalities. The second point refers to the main differences with the approach described by Chesbrough; to this end, the concept of *open dimension* of knowledge is the core of the *open innovation*, and means that it has to be made available to any interested subject, without discriminations (von Hippel, von Krogh, 2003). The latter point sets forth the difference between a scenario in which corporation make public and shareable their knowledge only in particular moments, to another in which such knowledge is constantly spread and shared.

2.2 The “open innovation 2.0” and the importance of the users and the ICTs

The constant evolution of the open innovation paradigm is tied to the multiple variations affecting the surrounding environment, among which has to be mentioned the need to involve as many people as possible within the innovation process, as well as the importance of support from ICTs, who play as a first rate factor of cooperation between subjects. A central role is then played by the concepts of value and shared vision: corporations change their logics, shifting from a small-period optimization of financial performances, to the pursue of a broader optimization of both internal performances and social conditions – that is, the creation of value for the social context the corporation lives in. Speaking therefore of *open innovation 2.0* means the search for a new organizational logic, based on principles such as: integrated cooperation, co-creation of shared value, innovation ecosystems implying the participation of multiple actors within the innovation processes, rapid adoption and use of technologies able to generate high performing values, thanks to which the traditional “borders” between activities fades out (Song, Cornford, 2006), and the creation of networking between innovators and the surrounding

environment becomes possible. Similarly, the existing gaps between lab researchers, R&D activities, and the final users, is overcome, in favour of an easier and more efficacious “open cage” of interactions.

The active support of technologies permits to create and perform innovation where the participation of the users is actual; on the other hand, the proper use of ICTs grants the co-evolution of knowledge and the spreading of the innovation generated after the spreading of creativity and knowledge themselves: the expected result is the transformation of the whole society, through the rising of knowledge-based organizational forms, network relations and information-based ecosystems (Malone, 1987).

Inside such processes the importance of the users increases, too. ICTs push towards the *open innovation 2.0* paradigm by providing them with more flexible approaches to the innovation, allowing therefore a greater integration between traditional and innovative services and products, and eventually shifting from an innovation decided and driven from few high qualified subjects, to an innovation born from multiple and multidisciplinary skilled actors with. Thus, users are no longer seen as passive receptors, but as active parts of the innovation process, or better a value co-creator. It's easy therefore to conclude that the more the connectivity and networking dimensions increase, the more the users will be called to act as value co-creators, with high expectations (Curley, Formica, 2013). If in the words of Baldwin & Curley (2007) innovation is the adoption of a new element that creates value for individuals and organizations that adopt it, the user himself tends to become the cornerstone of the innovation-generated values; in other words, the *user* is the most suitable subject to determine the value that an innovation is supposed to bring to its beneficiaries. The support of the technologies opens the way to an increasing of the social interactions as well between multiple experienced and motivated stakeholders, with the creation of trust bonds: this leads in turn to the creation of more shared innovative ideas and the development of manifold options of services and products deployment.

2.3 Towards an “innovation ecosystem”

Besides the centrality of the users and the key role of ICTs, the upstream logic features the concept of innovation ecosystem, as the result of a sort of spiral involving government institutions, corporation, universities and final users, aimed at co-creating innovation, improvements and structural changes, different from those a single subject could afford; of course, the more shared vision is achieved, the more efficacious the model will be. An innovation ecosystem can be therefore described as an inter-

organizational, political, economical, environmental and technological network, through which a social compound can contribute to the overall improvement of the innovation among the involved organization (Russell, Still, Huhtamaki, Yu & Rubens, 2011).

3 An empirical verification: the open innovation in the pharmaceutical sector

3.1 The introduction of the open source logic

The pharmaceutical sector is an important example of the application of the open innovation paradigm, where we witness the interplay of multiple actors, public and private, aimed at the creation of new knowledge and innovation and to the transfer of the same.

It seems only right to first see how this industry has always faced critical problems and was not able to provide a high satisfaction of the needs of the community. In fact, the processes of R&D in the pharmaceutical industry are very complex, requiring large financial investments, the provision of highly qualified human resources (which have a high cost), structures and expensive machinery, and so on, as well as being characterized by long time durations and high risk of unsatisfactory results. In this way, a firm faced with high costs incurred during all phases of research and development, it could bring to market a new product, invention or formula, not any time soon, arguing for the duration of the processes described in the first risk that these results are not positive and therefore not generating value on the market. Similarly, because of these problems, we are seeing many neglected diseases, those diseases are not common, than which pharmaceutical companies could not implement the processes and stages of R&D because, in terms of costs and risks described above with respect to such implementation, there is not a large enough market able to remunerate such investments and the risk assumed.

This sector has become increasingly focused on the sharing of information. Thus, it was decided to apply the logic implemented in the software field, the open-source⁵ concept, even in these sectors and backgrounds. In this way, it should be to affirm importance of R&D pharmaceutical industry through the application of an open-source model developed in the context of computing industries. In this context, however, the

⁵ *Open source means, in computer science, software whose authors allow and facilitate the analysis and the modifications made by other independent parties, through the use of appropriate licenses. In this case, these licenses, as described in the third chapter, provide that persons who benefit from access to the software code, must then be made available to all the possible changes and implementations carried out.*

logic of open-source does not refer to the source code of the software, but instead of open source contributors. Similarly, there are many differences between the two areas considered (scope software and biological), as regulatory mechanisms that limit the application of this logic to the development of drugs. However, in the pharmaceutical field have established important partnerships and networks composed of public and private organizations that have adopted this concept open-source, combining it with a concept of outsourcing, in order to generate a new business model based on lower costs.

Question 1: It would form a logical open innovation where pharmaceutical companies can be supported by a variety of other organizational actors with high skills and knowledge (such as universities or public research organizations), and confer outsourced to these important institutions stages and parts research and development.

The result would be a hybrid model, in which a part of the processes of pharmaceutical R&D are based on a logic open-source, while another part would be outsourced . In this way, it would be to create a model aimed at sharing and transfer of knowledge and innovation, through collaborations that would be created. For proper implementation of this model, however, high capacity and high project leadership experience in all minimum -party process R&D pharmaceuticals are required. Since these abilities are present mainly in the big pharmaceutical companies, we see how the logic of open-source rather than being a threat to conventional processes of R&D in this area, may be a way that will enhance the ability of large companies to the end to achieve those objectives will not be achieved economically from the traditional model , such as the development of drugs and treatments for neglected diseases.

Question 2: In this way, the model could be a way to turn properly in those niche markets that can not be supported, for the reasons described above, from large pharmaceutical companies.

3.2 The problems related to the application of open source to the pharmaceutical sector

After delineated the main characteristics of the logic open-source, so it is essential to understand its application to the pharmaceutical industry. In particular, as already outlined, if organizations can adopt this logic, this would confer important benefits for those projects aimed at the development of drugs for neglected diseases, for which you will hear high needs by consumers but unfortunately there will be many problems which hinder the development of the same, as described above. There are, however, significant barriers to the implementation of the approach R&D in the pharmaceutical field.

In particular, we are witnessing an economic issue, instead working in ICT and software is not present. Indeed, if in the latter logic that allows all participants to support this model through the basic means (computer hardware and Internet connection), in the pharmaceutical field, in order to discover and develop new formulas and medications will be necessary structures that will require large investments, such as specialized laboratories. The dynamics of research between the two sectors also differ in factors other than where each of these, the application logic of the open-source appears much more complex in the case of the pharmaceutical industry. In particular, in the case of software development, we do not have a phase of discovery. Once the goal is defined, programmers begin to devote to the project and create steady progress towards your goal. Conversely, the discovery of new drugs can not be generated until a certain amount of knowledge inherent in the disease object of analysis, has been accumulated. This acquisition of knowledge may require an extremely long period of time, without any possibility to know or understand from the beginning if the knowledge this is sufficient or if it takes a long period of time instead of the complex search in order to acquire the necessary knowledge, before innovation can be engendered. Unfortunately, the development of software is much simpler: it crosses few disciplines and is not subject to the complex clinical trials. For the most part, a single programmer can hold all the skills and competencies required to write a program from start to finish. By contrast, drug development requires the coordination of many highly qualified individuals who exhibit skill and expertise differences between them and non-overlapping. The knowledge in the biomedical field must be reviewed and played by actors with the same capacity before it is accepted knowledge .

This process is slow and highly expensive. Moreover, in contrast to drug developers, publishers of software are subject to regulations but not complex but mild. These do not require specific approvals from government agencies responsible for monitoring the sector, given the different impact on the health and safety of individuals in the fields of pharmaceuticals and information technology. Moreover, among the two sectors also have different risks inherent failures or errors on the part of those involved in research and development. The error generated by a software programmer rarely endangers the objectives of the project or other entities, and mistakes in this area can be easily fixed by patching (which remedy solution to a programming error), without be in need of rewriting, from the beginning, the whole program. Instead, in the case of drugs, problems or errors on the part of the subjects, may impair long period of research and development, with the consequent cost of very high financial resources.

Finally, to conclude this analysis, the two sectors follow different regimes on intellectual property. A software is protected by copyright law instruments that come automatically when the code is written, even though it was not legally registered any files. Instead, research in the field of pharmacy is protected by patent which are expensive to store and maintain legally, and for which the meeting legal standards that define innovation is much more complex.

3.3 The implementation of open innovation in the pharmaceutical sector: the case of public-private partnerships

In relation to the considerations made in the light of the problems described in the pharmaceutical industry has gone assuming a logic of open innovation, through training, as already mentioned, the partnership between public and private actors, which has allowed the development of a new and reasonable business model, which emulates the characteristics of collaborative design of open source, analyzed above.

This conception of the network then generates innovative formats from multiple types of public and private actors, responsible for the creation and sharing of knowledge and innovation in order to support research and development in the pharmaceutical industry, seeking to address the barriers and challenges that characterize these processes. In this sense, an important example is the Medicines for Malaria Venture, a non-profit entity that has an underlying type of network as described above, which is responsible for the discovery and development of new drugs against malaria and reliable. This entity presents separate projects, for which we are witnessing an open concept, where any interested party that is able to contribute with their ideas and contributions. In this way, the logic benefits from the skills and creativity of many volunteers. Subsequently, a scientific committee, made up of highly qualified and experienced individuals, analyzes and reviews the contributions made by choosing those projects with the greatest potential value, which will then be funded later.

Each project selected in this way will then be awarded and transferred to the underlying network, which will focus on the processes of R&D related. This network will consist of a large number of scientists and public and private institutions (especially universities, large pharmaceutical companies, research institutions and biotechnology).

The funds and financial resources needed to support these processes will come from public partners and philanthropists. After each step, the committee reviews the data described above and decide whether to proceed or not to support the project. As for the production of drugs developed, such entities gives the outsourced partners who can run it

at low cost, and then sell it at cost price in developing countries, and market them through specialized partners in these markets. In addition, we are seeing multiple partnerships and networks formed by organizational actors both public and private, that share a common profile and logic. First, these are mainly focused on neglected diseases. Second, they operate as a virtual pharmaceutical companies, with a small staff of human resources, which captures the ideas from the outside (which, as already described, may be brought by any interested party), shall examine them and submit to the control of expert committees, and then transfer the processes of R&D related to the network of public and private institutions. Similarly, these partnerships are able to operate on the basis of financial budgets not substantial.

This makes things such partnership arrangements to fund research in areas that could not be financed, viably, from the traditional model of R&D in the pharmaceutical sector, as already described. From the considerations made, it is clear how such a fundamental factor underlying logic of these partnerships, networks and open innovation, is represented by the open sourcing. In particular, according to this conception, the model underlying these networks should allow all stakeholders to participate and contribute. These volunteers then will give ideas and contributions, will review the contributions of other individuals, can implement changes and progress in certain items, and then make them public, discuss with other individuals, and so on. Over time, the best ideas and contributions will be able to gain more authority in the general environment and science.

The reference of this work is to study “*Analysis of the regional pharmaceutical policy*” was conducted in 9 Italian regions (Umbria, Sicily, Campania, Veneto, Lombardy, Puglia, Emilia Romagna, Tuscany, Lazio), and 45 interviews were conducted with the interested parties. The methodological novelty of the study lies in the fact that typically in each region has been collected the testimony of the Assessor or the Chief of the assessor of the policy maker of the drug, the regional manager SIFO, DG ASL and AO and their managers of the drug, allowing you to see the different perceptions on the issues under study and analyze the same time as they are mediated by the needs of regional policy. Among the most significant aspects emerged from the research, we can cite the great diversity of opinion on the effectiveness of the instruments of governance of the pharmaceutical industry, which seems more related to the accession to the choices made by individual regions as part of their federal autonomy, rather than on the basis of considerations of evidence of policies; low confidence in the instruments of economic governance (such as partnerships) and a great deal of attention to the appropriateness, however, declined differently in different contexts; the major concern for the Government

of innovation, but also a lack of confidence in the objective assessment tools, such as HTA (Health Technology Assessment); awareness that the pharmaceutical sector, albeit with some shortcomings on the side of hospital expenditure, is subject to more thorough and careful monitoring and control.

To analyze the regional pharmaceutical policies we have to reason on 2 levels: (i) a more objective one, linked to the numbers and results; (ii) a more specific if not subjective, that is the analysis of what is happening in the regions not so much on the past than in the future.

The regions agree that pharmaceutical expenditure have effective monitoring systems work best, while all the regions are struggling on the control of specialist and medical devices: we focus on the pharmaceutical industry, more controllable, and lacks the ability to act on other sectors. The pharmaceutical industry is important in terms of appropriateness, as if to signify that it would be possible to further rationalization. It requires the use of tools Health technology assessment (HTA) for a greater rationalization of performance and appropriate medication management. The partnerships become the organizational form most appropriate to achieve these objectives.

The concept of open source outlined has many advantages and benefits for research and development in the pharmaceutical field, result even more effective for the purpose of promoting innovation than the traditional alliances that are made in a few actors such as biotechnology and pharmaceutical companies. In fact, the network based on the open-source logic are formed by a larger number of weak ties (flexible relationships), whereas the traditional alliances are based on the strength of the connections between the partners. These weak ties generate a greater number of innovative ideas, since there is a flexible multiple relationships between a multitude of diverse organizational actors and volunteers, thus allowing a greater discussion, argument and debate of these; whereas strong ties tend to reinforce existing logics and therefore are not thesis mainly to the formation of innovative ideas (DeBresson, 1991).

Over this conceptualization, are listed below, the benefits and advantages that partnerships and networks of public-private partnerships have, compared to traditional logic of the R&D sector:

- *agility*: this logic makes it easier to finish the projects which do not appear promising. In fact, the management of individual projects will not have to haggle with the supporters of specific projects, to save them, could cause delays or increased costs;

- *creativity*: these partnerships enable multi-stakeholder experts and specialists, regardless of geographic location (thanks to the development of ICTs), to contribute with their own ideas. In this way, you can harness the creativity, skills, abilities and different conceptions of thought of a very large number of parties involved. In this way, this number appears much greater than the number of specialists generally available within organizations of research using a methodology of traditional R&D;
- *focus*: these networks focus on one or a few targets, namely prevention and treatment of a few diseases;
- *lower availability of resources*: such partnerships require fewer resources of facilities and resources, compared to those required pharmaceutical companies to carry out R&D traditional processes. In fact, by exploiting the knowledge, skills and resources of the network, it allows organizations involved in such networks, though small in size (and therefore with a lower endowment of resources), to implement processes more effective than those of large companies with logical research and development traditional;
- *speed*: these partnerships are characterized by rapid decision-making processes, thanks in part to the fact that they do not have to meet specific requirements or obligations;
- *cost advantages*: such partnerships, as already outlined, will be able to operate on the basis of reduced budgets. In fact, these entities will be composed of a few subjects, reduced overhead and will not need expensive infrastructure. These entities will rely instead on the capacity of the partners of the network, which will be priced capacity, the market, at a marginal cost instead of the full one. In addition, these entities will give outsource those activities and expensive compared to what we are seeing cost benefits under this policy, such as the production of drugs and sought their dissemination in countries in the developing world. Finally, in addition to receiving donations from different subjects, these partnerships will focus on neglected diseases by big companies, for which the costs will be lower.

3.4 Issues and criticisms of partnerships and open source in the pharmaceutical sector

The logic introduced in the present paper has to deal with a certain number of potential issues, that may jeopardize both benefits and results. In particular:

- *funding*: even if such partnerships have collected sufficient funds, it may determine the problems when more projects will be in a clinical development slow and expensive. In this way, the funds raised will be deployed on these projects, leading to a possible lack of financial resources for some of these;
- *sustainability*: some of the projects covered by such partnership, come from the same companies that have shelved because of insufficient commercial prospects. To continue to operate effectively and efficiently, these networks must therefore integrate its portfolio of projects. Moreover, given the complexity of the areas treated, there are high risks in some areas of science, the set of shared contributions may be too low in order to make the necessary processes and research and development in order to generate appropriate solutions;
- *availability of qualified human resources*: a large proportion of qualified individuals and industry experts reside within the pharmaceutical industry, which has a strong culture of ownership. To employees is constantly asked to give their intellectual achievements to the organizations they work for, even those results produced in their own time. However, two possible factors could change this situation, by giving qualified human resources to the network based on the open-source model. Many individuals highly skilled and knowledgeable in this field are close to retirement and then exit from these organizations, who might be interested the opportunity to use their skills for purposes very valuable and positive for the community, such as those of such partnerships. In addition, drug companies could be persuaded to loosen its restrictions on the involvement of its employees in such activities, since often the role internal to an organization of a subject is not in conflict with the role it could take in such activities. In doing so, these companies may obtain a positive reputation within the company, allowing its employees to seek cures for diseases in which the companies themselves do not show interest;
- *availability of data and tools*: the lack and scarcity of data in certain areas can cause problems that reduce benefits and limit the activities of R&D processes according to the logic of open-source. In addition, in specific scientific fields in order to work on projects, tools are needed or not, which may be highly expensive. However, developments in computer science, along with the public dissemination of computer software, has also allowed the volunteers to have access to tools, previously accessible only by companies in the sector;

- *intellectual leadership*: the connection of competent individuals does not guarantee the production of value. In this case, you need a strong leadership and guidance for the various actors and individuals who participate and contribute. For processes of pharmaceutical R&D focused on the open-source logic, the presence of a subgroup of highly qualified innovative contributors that can be addressed positively and grant contributions, as well as support them with their own ideas, it can act as a catalyst. Without leadership, the contributions of individuals may prove to be superficial and low.

4 Conclusions

The analysis conducted shows that the open innovation has generated fundamental changes discernible in a new organizational logic, a new business philosophy, which distinguishes firms and behaviors of the same with regard to the activities of knowledge and innovation itself.

Obviously the open innovation, as evolving paradigm, has been subject to important theoretical developments, discernible, to name only a few, in the upstream theories that have expanded the logic of *openness* (compared with the traditional open innovation paradigm) in creating an *open innovation 2.0* paradigm.

The pharmaceutical sector is a clear example of the application of a logic inherent in open innovation processes innovation. It can be seen as elements are present in this area of complexity of innovative processes that determine the need to adopt logical openness. In fact, we focus primarily on the acquisition and exploitation of knowledge and skills to other external parties, we are not seeing a focus on internal resources and ideas. The users then share their experiences, knowledge and ideas. In this way, it assists the passage for the user, as outlined more times, by a simple role of the recipient, subject to one of proactive, that will be involved in a significant way in innovative processes. In this way, the systems and the environment created assume a logic centered about the user. Obviously, to get these phenomena and advantages, you will have to enable the active involvement of those users.

In this sense, the logic analyzed in this area, featuring as well web 2.0, ICTs, policies strongly of open public-private partnerships (in pharmaceuticals), are able to generate a high level of active participation by users. They play an important role in public and private entities, such as hospitals, clinics and healthcare organizations (in the case of the health care sector), as well as universities and research and development in the case of the

pharmaceutical industry, through the formation of networks implemented by the partnership public-private partnerships with them.
