
Slime Mould in Arts and Architecture

RIVER PUBLISHERS SERIES IN BIOMEDICAL ENGINEERING

Series Editor:

DINESH KANT KUMAR

RMIT University

Australia

Indexing: All books published in this series are submitted to the Web of Science Book Citation Index (BkCI), to SCOPUS, to CrossRef and to Google Scholar for evaluation and indexing.

The “River Publishers Series in Biomedical Engineering” is a series of comprehensive academic and professional books which focus on the engineering and mathematics in medicine and biology. The series presents innovative experimental science and technological development in the biomedical field as well as clinical application of new developments.

Books published in the series include research monographs, edited volumes, handbooks and textbooks. The books provide professionals, researchers, educators, and advanced students in the field with an invaluable insight into the latest research and developments.

Topics covered in the series include, but are by no means restricted to the following:

- Biomedical engineering
- Biomedical physics and applied biophysics
- Bio-informatics
- Bio-metrics
- Bio-signals
- Medical Imaging

Preface

Acellular slime mould *Physarum polycephalum* has a rich life cycle that includes fruit bodies, spores, single-cell amoebas, and syncytium. At one phase of its cycle, the slime mould becomes a plasmodium. The plasmodium is a coenocyte: nuclear divisions occur without cytokinesis. The plasmodium is a single cell with thousands of nuclei. The plasmodium is a large cell. It can expand up to several meters when conditions are good. The plasmodium consumes microscopic particles and bacteria. During its foraging behaviour, the plasmodium spans scattered sources of nutrients with a network of protoplasmic tubes. The plasmodium optimises its protoplasmic network to span all sources of nutrients, stay away from repellents and minimise transportation of metabolites inside its body. The plasmodium's ability to optimise its shape attracted the attention of biologists, then computer scientists and engineers. Thus, the field of slime mould computing was born.

In the last 15 years, over 50 sensing and computing devices have been invented with the slime mould. The field of *Physarum* computing flourished and got widely publicised in papers and monographs. While getting fame in science and engineering, *P. polycephalum* lived a second life. The slime mould's adaptability, polymorphism and aestheticism inspired artists and architects. The slime mould has been seen as a self-conscious fluid form continuously changing its shape in response to external stimulation and due to interactions of thousands of micro-oscillators in its body. Elusiveness is a magic feature of the slime mould. One moment the slime mould gives you a solution to a mathematical problem by a shape of its body, next moment it changes its shape and the solution disappears. The authors of this book employ this momentariness of structure of an "unstructured" creature.

The book presents a set of unique chapters by leading artists, architects and scientists resulted from creative translations of the slime mould behaviour into forms and sounds, unconventional investigations and sensorial experiences and the slime mould ability to remove boundaries between living and artificial, solid and fluid, science and arts. The book gives readers unique tools for designing architectural forms and creative works using the slime

mould, understanding how proto-cognitive living substrates can be used in every day life, it sparks new ideas and initiates further progress in many fields or arts, architecture, science and engineering.

Vibrant concepts of biology, arts, non-linear sciences and architecture interact in the book towards the formation of an unorthodox vision of the future and emergent concepts of a socium, where science and art are becoming a single unity. The striking polymorphism of contributions reflects the vibrant development of the field of bio-inspired and bio-integrated arts and architecture. This makes the book stand out from the standard art, science and architectural book. The book provides in-depth insight and first-hand working experiences into current production of art works at the edge of art, science and technology. The book is a unique compendium of works made by a new type of artists and architects who are not only concerned with the visual level of their work but also with scientific conceptualization and theoretical reflection on contextualization of their studies and work in the interdisciplinary field of art and science. All contributors of the book are world-leading artists, architects or scientists, with an impressive track record of exhibitions, installations and scientific and engineering discoveries. They provide in-depth insights and first-hand working experiences into current developments of artistic and architectural works at the edge of art, science and technology.

Figure 4.6	Translation of current readings into pitches.	50
Figure 4.7	Resistor's response for pitches in Fur Elise. Solid line is the resistor reading calculated by using Ohm's law. The output generated is $E5 \rightarrow D\#5 \rightarrow E5 \rightarrow D\#5 \rightarrow E5 \rightarrow B4 \rightarrow D5$	51
Figure 4.8	52
Figure 5.1	Slime mould being fully embraced by Hampshire College as visiting non-human scholars. Above: Screenshot from the School of Natural Sciences faculty page. Below: <i>Physarum polycephalum</i> 's office in the basement of the Cole Science Center.	62
Figure 5.2	Top – Students working with staff and faculty to brainstorm human problems and possibilities for modeling them with slime mould. Bottom – Students working in the lab to set up their experiments.	67

Figure 5.3	The bus route problem became a major graphic feature of the Plasmodium Consortium exhibition, which proposed a new route laid out in blue across a stylized public transport route map.	69
Figure 5.4	A Petri dish was set up with concentrated valerian root, a sleep aid, in the center and decreasing concentrations moving outward. The outer rings also contained protein and sugar. Adamatzky (2011) showed when <i>Physarum polycephalum</i> was given a binary choice between food or valerian root, it moved toward the valerian root. We have observed behaviors similar to addiction to valerian root, such as a decrease in metabolic activity. In this experiment, we were able to lure slime mould away from the concentrated drug by surrounding it with increasingly healthier options across a gradient. This led the slime mould to the food source before it became metabolically inactive. Jonathon Keats postulated that this weaning study might offer a correlate for policy discussions of less harmful or concentrated drugs (such as cannabis) being used to move users from serious addiction towards more healthful choices. Experiments were conducted by Matthew Hinderhofer, Rick Noble, and Hannah Davidson.	70
Figure 5.5	The border problem was given context with an infographic providing background information. . .	71
Figure 5.6	Petri dishes model two border scenarios: open border (top) and closed border (bottom). Protein and carbohydrate sources were placed on either side of the border and predictably, the slime mould grew more extensively and lasted longer in the open border setup. Border experiments were conducted by Rick Noble.	72
Figure 5.7	Letter to the Secretary of Homeland Security from the Plasmodium Consortium making recommendations based on slime mould simulations of border scenarios.	73

Figure 16.7	The Chemical Machine learns from this adaptive biological system of self regulation and intercellular communication between parts. This feature allows constant morphological computation for responding to ever changing environmental conditions and thus ensures the survival of the system. Chemical signalling allowing morphological computation as a form of self-regulation enables high fault tolerance and systemic robustness. <i>Time lapse Slime Mould Petri Dish test</i>	271
