

Figure S1. Scatter Plot showing the relationship between mean fixation duration in infancy and effortful control in childhood. The x-axis represents the normalized scores of individual mean fixation duration.

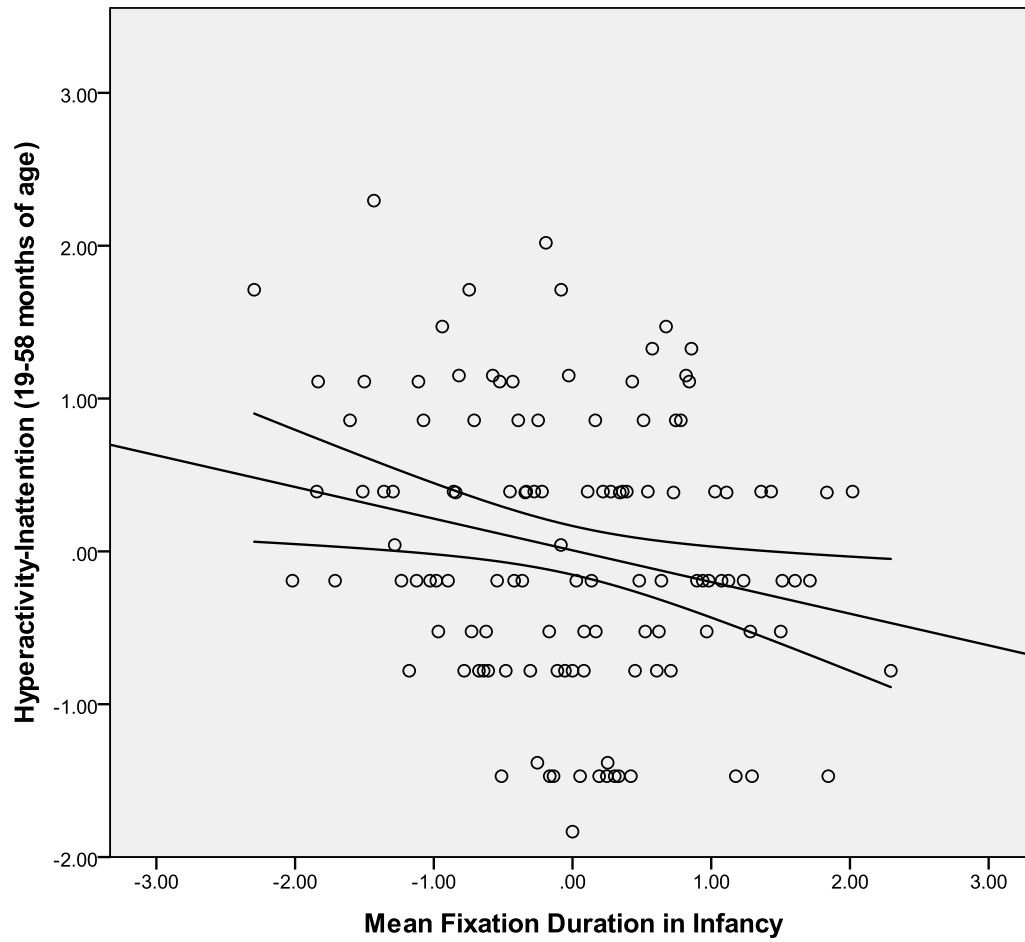

Note. The line represents the best-fit line of the model and the confidence bands surrounding the line represent the 95% confidence intervals of the best-fit line

Figure S2. Scatter Plot showing the relationship between mean fixation duration in infancy and surgency in childhood. The x-axis represents the normalized scores of individual mean fixation duration.

Note. The line represents the best-fit line of the model and the confidence bands surrounding the line represent the 95% confidence intervals of the best-fit line

Figure S3. Scatter Plot showing the relationship between mean fixation duration in infancy and hyperactivity-inattention in childhood. The x-axis represents the normalized scores of individual mean fixation duration.

Note. The line represents the best-fit line of the model and the confidence bands surrounding the line represent the 95% confidence intervals of the best-fit line
